

# Package ‘IDF’

October 4, 2017

**Type** Package

**Title** Estimation and Plotting of IDF Curves

**Version** 1.1

**Date** 2017-09-29

**Author** Christoph Ritschel, Carola Detring, Sarah Joedicke

**Maintainer** Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>

**Description** Intensity-duration-frequency (IDF) curves are a widely used analysis-tool in hydrology to assess extreme values of precipitation [e.g. Mailhot et al., 2007, <doi:10.1016/j.jhydrol.2007.09.019>]. The package 'IDF' provides a function to read precipitation data from German weather service (DWD) 'webwerdis' <<http://www.dwd.de/EN/ourservices/webwerdis/webwerdis.html>> files and Berlin station data from 'Stadtmessnetz' <<http://www.geo.fu-berlin.de/en/met/service/stadtmessnetz/index.html>> files, and additionally IDF parameters can be estimated also from a given data.frame containing a precipitation time series. The data is aggregated to given levels yearly intensity maxima are calculated either for the whole year or given months. From these intensity maxima IDF parameters are estimated on the basis of a duration-dependent generalised extreme value distribution [Koutsoyannis et al., 1998, <doi:10.1016/S0022-1694(98)00097-3>]. IDF curves based on these estimated parameters can be plotted.

**Depends** stats4, evd, ismev

**License** GPL (>= 2)

**RoxygenNote** 5.0.1

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2017-10-04 10:55:15 UTC

dgev.d	<i>Density function of modified generalized extreme value distribution</i>
--------	----------------------------------------------------------------------------

---

### Description

The function `dgev.d` is a modified version of the function `dgev` for different durations `d` developed by Koutsoyiannis et al. (1998).

### Usage

```
dgev.d(q, mu = 0, sigma = 1, xi = 0, theta = 0, eta = 1, d = 1,
       log = FALSE)
```

### Arguments

<code>q</code>	Vector of quantiles
<code>mu</code>	location value
<code>sigma</code>	scale value
<code>xi</code>	shape value
<code>theta</code>	value defining the curvature of the IDF
<code>eta</code>	value defining the slope of the IDF
<code>d</code>	vector of durations
<code>log</code>	logical option to use logarithmic parameter values, default=FALSE

### Value

`dgev.d` gives the density function

### Author(s)

Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>

### See Also

fit.fun

*Fitting function to optimize IDF model parameters***Description**

The function `fit.fun` fits IDF model parameters  $\mu, \sigma, \xi, \theta, \eta$  to a set of given observations `obs`, typically a series of yearly maxima at different durations `d`. Options for using logarithmic parameter values and debugging are given. Also the `optim` parameters `method` and `upper`, `lower` can be defined.

**Usage**

```
fit.fun(obs, dur, mu = 1, sigma = 1, xi = 0.5, theta = 1, eta = 1,
        use.log = F, DEBUG = F, method = "Nelder-Mead", upper = Inf,
        lower = -Inf)
```

**Arguments**

<code>obs</code>	vector of yearly intensity maxima at different durations. Order: Y1D1, Y2D1,...,YnD1,Y1D2,...YnD2,Y1D3,...YnD3
<code>dur</code>	vector of durations with same length as <code>obs</code> . Order: n x D1, n x D2, ... n x Dk
<code>mu</code>	location value
<code>sigma</code>	scale value
<code>xi</code>	shape value
<code>theta</code>	value defining the curvature of the IDF
<code>eta</code>	value defining the slope of the IDF
<code>use.log</code>	logical value for usage of logarithmic values, default is FALSE
<code>DEBUG</code>	logical value for usage of debugging, if TRUE the input parameters and the value of negative log-likelihood are printed on console for each iteration during optimization.
<code>method</code>	character defining the method to be used in <code>optim</code> , preferences are: "Nelder-Mead", "BFGS", "L-BFGS-B"
<code>upper</code>	vector specifying the upper boundary of parameters for "L-BFGS-B" method
<code>lower</code>	vector specifying the lower boundary of parameters for "L-BFGS-B" method

**Value**

`$min` value of negative log-likelihood at optimization minimum  
`$par` vector of IDF parameters at optimization minimum

**Author(s)**

Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>

IDF.fit

*Fitting IDF model parameters to observations at different durations***Description**

The function `IDF.fit` fits the IDF model parameters  $\mu, \sigma, \xi, \eta, \theta$  to a data.frame of observations data with temporal information (at least years) and values of precipitation at a given temporal resolution. This precipitation time series gets aggregated at given aggregation levels. `agg.lev` and yearly maxima of intensity are calculated for a specific month or the whole year/dataset. The starting values of the IDF model parameters can be determined by the user as well as specific options to use during optimization. Logarithmic transformation, debugging, the optimization method, and an option to plot the IDF curves.

**Usage**

```
IDF.fit(data, agg.lev = c(2, 3, 6, 12, 24, 48, 72, 96), month = "all",
        moving.sum = "FALSE", theta.init = 0, use.log = FALSE, DEBUG = FALSE,
        method = "Nelder-Mead", upper = Inf, lower = -Inf, plot = FALSE,
        probs = c(0.5, 0.9, 0.99), cols = c(rgb(1, 0, 0, 1), rgb(0, 1, 0, 1),
        rgb(0, 0, 1, 1)), station.name = "Berlin", data.name = "obs")
```

**Arguments**

<code>data</code>	a data.frame, preferably generated by function <code>IDF.read</code> . It should at least contain a <code>\$RR</code> and <code>\$year</code> element for the function to work properly.
<code>agg.lev</code>	a vector of aggregation levels used to fit the IDF curves.
<code>month</code>	integer value specifying the month to be used for estimating the IDF parameters. Type "all" for all months or if the whole time series should be fitted.
<code>moving.sum</code>	logical specifying if moving sum filtering should be applied for time series aggregation.
<code>theta.init</code>	initial value defining the curvature of the IDF, default is zero, it is not recommended to change it
<code>use.log</code>	logical value for usage of logarithmic values, default is FALSE
<code>DEBUG</code>	logical value for usage of debugging, if TRUE the input parameters and the value of negative
<code>method</code>	character defining the method to be used in <code>optim</code> , preferences are: "Nelder-Mead", "BFGS", "L-BFGS-B"
<code>upper</code>	vector specifying the upper boundary of parameters for "L-BFGS-B" method
<code>lower</code>	vector specifying the lower boundary of parameters for "L-BFGS-B" method
<code>plot</code>	logical option of creating a plot of IDF curves with estimated parameters.
<code>probs</code>	a vector of probabilities for which the IDF curves are calculated
<code>cols</code>	a vector of colors for the separate IDF curves, needs same length as <code>probs</code>
<code>station.name</code>	character overall naming of the IDF plot, e.g. name of location or model name
<code>data.name</code>	character naming the data points, e.g. obs or model name

**Value**

\$ints vector of sorted intensities for selected aggregation levels  
 \$durs vector of sorted aggregation levels  
 \$min minimum value of negative log-likelihood during optimization  
 \$par vector of estimated IDF model parameters  $\mu, \sigma, \xi, \theta, \eta$  at minimum value of negative log-likelihood.

**Author(s)**

Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>

**Examples**

```
RR <- rgamma(10*30*24, shape=1)
year <- sort(rep(1:(10), 30*24))
data <- data.frame(RR, year)
fit <- IDF.fit(data)
pars <- fit$par
```

---

IDF.nll

*Negativ log-likelihood of modified GEV*

---

**Description**

The function `IDF.nll` calculates the negative log-likelihood for a given set of model parameters  $\mu, \sigma, \xi, \theta, \eta$ , given observations  $x$  and given durations  $d$ . Options for the usage of logarithmic values `use.log` and a debugging function `DEBUG` are available.

**Usage**

```
IDF.nll(mu = 0, sigma = 1, xi = 0, theta = 0, eta = 1, x, d,
        use.log = F, DEBUG = F)
```

**Arguments**

<code>mu</code>	location value
<code>sigma</code>	scale value
<code>xi</code>	shape value
<code>theta</code>	value defining the curvature of the IDF
<code>eta</code>	value defining the slope of the IDF
<code>x</code>	vector of observations at different durations $d$
<code>d</code>	vector of durations
<code>use.log</code>	logical value for usage of logarithmic values, default is FALSE
<code>DEBUG</code>	logical value for usage of debugging, if TRUE the input parameters and the value of negative log-likelihood are printed on console.

**Value**

retruns weightes negative log-likelihood by number of observatons used

**Author(s)**

Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>

---

IDF.plot

*Plotting IDF curves*

---

**Description**

The function `IDF.plot` plots a set of IDF curves with given IDF model parameters `pars` for several probability levels `probs` at given durations `dur`. The colors of the curves can be defined with parameter `cols` (need to have same length as `probs`). The `station.name` will be printed in the legend.

**Usage**

```
IDF.plot(pars, probs = c(0.5, 0.9, 0.99), dur = c(0.5, 1, 2, 3, 6, 12, 24,
  48, 72, 96), cols = c(rgb(1, 0, 0, 1), rgb(0, 1, 0, 1), rgb(0, 0, 1, 1)),
  st.name = "Berlin-Dahlem", dt.name = "obs", ints = NA, ds = NA)
```

**Arguments**

<code>pars</code>	a vector of IDF model parameters <code>mu,sigma,xi,eta,theta</code>
<code>probs</code>	a vector of probabilities for which the IDF curves are calculated
<code>dur</code>	a vector of durations at which the IDF curves are calculated
<code>cols</code>	a vector of colors for the seperate IDF curves, needs same length as <code>probs</code>
<code>st.name</code>	character overall naming of the IDF plot, e.g. name of location or model name
<code>dt.name</code>	character naming the data points, e.g. <code>obs</code> or model name
<code>ints</code>	vector of observational intensities (surted by durations)
<code>ds</code>	vector of durations (same length as intensities)

**Author(s)**

Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>

**Examples**

```
RR <- rgamma(10*30*24, shape=1)
year <- sort(rep(1:(10), 30*24))
data <- data.frame(RR, year)
fit <- IDF.fit(data)
param <- fit$par
IDF.plot(pars=param, st.name="example", dt.name="rgamma")
```

---

IDF.read

*Reading precipitation data*

---

### Description

The function `IDF.read` reads a file in table format and creates a `data.frame` from it and adds some attributes (station information, aggregation time, data source). The only data values used are: date, precipitation. The `data.frame` will have the following format: | year | mon | day | hour | min | RR |  
|---+---+---+---+---+ | | | | | | |

### Usage

```
IDF.read(file, type)
```

### Arguments

<code>file</code>	a character string naming the file from which the data is to be read.
<code>type</code>	a character string defining the type of data to be read: either "stadtmessnetz" or "webwerdis", depending on if the data comes from the Stadtmessnetz Berlin or WebWerdis. If <code>type = "webwerdis"</code> , the data will be read, then sorted, formatted and missing lines added, while if <code>type = "stadtmessnetz"</code> , the data will just be read and formatted. Both source types have a different layout in the original file.

### Details

This function is designed to prepare a data file for doing an estimation on IDF parameters in function `IDF.fit`. The time given in the data is the end time, so the precipitation was measured up to that time.

### Value

Liste a `data.frame` of date and time information and precipitation values for each time step

---

`qgev.d`*Quantile function of modified generalized extreme value distribution*

---

**Description**

The function `qgev.d` is a modified version of the function `qgev` for different durations `d` developed by Koutsoyiannis et al. (1998).

**Usage**

```
qgev.d(p, mu = 0, sigma = 1, xi = 0, theta = 0, eta = 1, d = 1,  
       lower.tail = TRUE)
```

**Arguments**

<code>p</code>	Vector of probabilities
<code>mu</code>	location value
<code>sigma</code>	scale value
<code>xi</code>	shape value
<code>theta</code>	value defining the curvature of the IDF
<code>eta</code>	value defining the slope of the IDF
<code>d</code>	vector of durations
<code>lower.tail</code>	logical if TRUE (default), probabilities are $P[X \leq x]$ , otherwise, $P[X > x]$

**Value**

`qgev.d` gives the quantile function

**Author(s)**

Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>

rgev.d	<i>Random generation for the modified generalized extreme value distribution</i>
--------	----------------------------------------------------------------------------------

---

### Description

The function `rgev.d` is a modified version of the function `rgev` for different durations `d` developed by Koutsoyiannis et al. (1998).

### Usage

```
rgev.d(n, mu = 0, sigma = 1, xi = 0, theta = 0, eta = 1, d = 1)
```

### Arguments

<code>n</code>	Number of observations
<code>mu</code>	location value
<code>sigma</code>	scale value
<code>xi</code>	shape value
<code>theta</code>	value defining the curvature of the IDF
<code>eta</code>	value defining the slope of the IDF
<code>d</code>	vector of durations

### Value

`rgev.d` generates random derivatives

### Author(s)

Christoph Ritschel <[christoph.ritschel@met.fu-berlin.de](mailto:christoph.ritschel@met.fu-berlin.de)>

`TS.acc`*Accumulation of a time series*

---

**Description**

TS.acc accumulates a given time series `x` at a given accumulation level `acc.val`. Minimum value for `acc.val` is 2 [unit time]. Option for using moving sum is given.

**Usage**

```
TS.acc(x, acc.val, moving.sum="FALSE")
```

**Arguments**

<code>x</code>	vector of a time series
<code>acc.val</code>	value specifying the accumulation level, minimum value is 2
<code>moving.sum</code>	logical 'TRUE' means moving sum will be applied

**Value**

`x.acc` TS.acc returns a vector of an accumulated time series

**Author(s)**

Christoph Ritschel <christoph.ritschel@met.fu-berlin.de>  
Carola Detring <carola.detring@met.fu-berlin.de>

**Examples**

```
TS <- rgamma(n=1000, shape=1)
acc.2 <- TS.acc(TS, acc.val=2)

acc.24 <- TS.acc(TS, acc.val=24, moving.sum=TRUE)
```
