

Package ‘sunburstR’

November 5, 2019

Type Package

Title Sunburst 'Htmlwidget'

Version 2.1.3

Date 2019-11-04

Maintainer Kent Russell <kent.russell@timelyportfolio.com>

URL <https://github.com/timelyportfolio/sunburstR>

BugReports <https://github.com/timelyportfolio/sunburstR/issues>

Description Make interactive 'd3.js' sequence sunburst diagrams in R with the convenience and infrastructure of an 'htmlwidget'.

License MIT + file LICENSE

LazyData TRUE

Imports d3r (>= 0.6.9), dplyr, htmlwidgets, htmltools

Suggests jsonlite, knitr, markdown, pipeR, testthat, tidyr (>= 0.7.0), rmarkdown

Enhances treemap

RoxygenNote 6.1.1

VignetteBuilder knitr

NeedsCompilation no

| add_shiny | <i>Add Shiny Events</i> |
|-----------|-------------------------|

Description

Add Shiny Events

Usage

```
add_shiny(sunburst = NULL)
```

Arguments

sunburst sunburst htmlwidget to which you would like to add event handling

Value

sunburst htmlwidget

Examples

```
## Not run:

library(shiny)
library(sunburstR)

sequences <- read.csv(
  system.file("examples/visit-sequences.csv", package="sunburstR")
  ,header=F
  ,stringsAsFactors = FALSE
)

server <- function(input,output,session){

  output$sunburst <- renderSunburst({
    #invalidateLater(1000, session)
  })
}
```

```

    sequences <- sequences[sample(nrow(sequences),1000),]

    add_shiny(sunburst(sequences))
  })

  selection <- reactive({
    input$sunburst_mouseover
  })

  output$selection <- renderText(selection())
}

ui<-fluidPage(
  sidebarLayout(
    sidebarPanel(

    ),

    # plot sunburst
    mainPanel(
      sunburstOutput("sunburst"),
      textOutput("selection")
    )
  )
)

shinyApp(ui = ui, server = server)

# an example with d2b sunburst and Shiny
library(shiny)
library(sunburstR)

# use a sample of the sequences csv data
sequences <- read.csv(
  system.file("examples/visit-sequences.csv",package="sunburstR")
  ,header = FALSE
  ,stringsAsFactors = FALSE
)[1:200,]

# create a d2b sunburst
s2b <- sund2b(sequences)

options(shiny.trace=TRUE)
ui <- sund2bOutput("s2b")
server <- function(input, output, session) {
  output$s2b <- renderSund2b({
    add_shiny(s2b)
  })
}
shinyApp(ui, server)

```

```
## End(Not run)
```

d2b-shiny

Shiny bindings for d2b

Description

Output and render functions for using d2b within Shiny applications and interactive Rmd documents.

Usage

```
sund2bOutput(outputId, width = "100%", height = "400px")
```

```
renderSund2b(expr, env = parent.frame(), quoted = FALSE)
```

Arguments

| | |
|---------------|--|
| outputId | output variable to read from |
| width, height | Must be a valid CSS unit (like '100%', '400px', 'auto') or a number, which will be coerced to a string and have 'px' appended. |
| expr | An expression that generates a d2b |
| env | The environment in which to evaluate expr. |
| quoted | Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable. |

sunburst

'd3.js' Sequence Sunburst Diagrams

Description

Sequences **sunburst** diagrams provide an interactive method of exploring sequence data, such as website navigation paths.

Usage

```
sunburst(data = NULL, legendOrder = NULL, colors = NULL,
  valueField = "size", percent = TRUE, count = FALSE,
  explanation = NULL, breadcrumb = list(), legend = list(),
  sortFunction = NULL, sumNodes = TRUE, withD3 = FALSE,
  width = NULL, height = NULL, elementId = NULL,
  sizingPolicy = NULL, csvdata = NULL, jsondata = NULL)
```

Arguments

| | |
|---------------|--|
| data | data in csv source,target form or in nested d3 JSON hierarchy with 'name:..., children:[];'. csvdata and jsondata arguments are now deprecated in favor of this single data argument. list, character, or connection data will be assumed to be JSON. data.frame data will be assumed to be csvdata and converted to JSON by sunburstR::csv_to_hier(). |
| legendOrder | string vector if you would like to manually order the legend. If legendOrder is not provided, then the legend will be in the descending order of the top level hierarchy. |
| colors | vector of strings representing colors as hexadecimal for manual colors. If you want precise control of colors, supply a list with range and/or domain. For advanced customization, supply a JavaScript function. |
| valueField | character for the field to use to calculate size. The default value is "size". |
| percent | logical to include percentage of total in the explanation. |
| count | logical to include count and total in the explanation. |
| explanation | JavaScript function to define a custom explanation for the center of the sunburst. Note, this will override percent and count. |
| breadcrumb | list to customize the breadcrumb trail. This argument should be in the form list(w =, h =, s =, t =) where w is the width, h is the height, s is the spacing, and t is the tail all in px. w is 0 by default for breadcrumbs widths based on text length. |
| legend | list to customize the legend or logical to disable the legend. The list argument should be in the form list(w =, h =, r =, s =) where w is the width, h is the height, s is the spacing, and r is the radius all in px. |
| sortFunction | JS function to sort the slices. The default sort is by size. |
| sumNodes | logical to sum non-leaf nodes. The default sumNodes = TRUE assumes that the user has not already calculated a sum. |
| withD3 | logical to include d3 dependency from d3r. As of version 1.0, sunburst uses a standalone JavaScript build and will not include the entire d3 in the global/window namespace. To include d3.js in this way, use withD3=TRUE. |
| height, width | height and width of sunburst htmlwidget containing div specified in any valid CSS size unit. |
| elementId | string id as a valid CSS element id. |
| sizingPolicy | see sizingPolicy . |
| csvdata | deprecated use data argument instead; data in csv source,target form |
| jsondata | deprecated use data argument instead; data in nested d3 JSON hierarchy with 'name:..., children:[];' |

Examples

```
library(sunburstR)

# read in sample visit-sequences.csv data provided in source
```

```

# only use first 100 rows to speed package build and check
# https://gist.github.com/kerryrodden/7090426#file-visit-sequences-csv
sequences <- read.csv(
  system.file("examples/visit-sequences.csv", package="sunburstR")
  ,header = FALSE
  ,stringsAsFactors = FALSE
)[1:100,]

sunburst(sequences)

## Not run:

# explore some of the arguments
sunburst(
  sequences
  ,count = TRUE
)

sunburst(
  sequences
  # apply sort order to the legends
  ,legendOrder = unique(unlist(strsplit(sequences[,1], "-")))
  # just provide the name in the explanation in the center
  ,explanation = "function(d){return d.data.name}"
)

# try with json data
sequence_json <- jsonlite::fromJSON(
  system.file("examples/visit-sequences.json", package="sunburstR"),
  simplifyDataFrame = FALSE
)
sunburst(sequence_json)

# try with csv data from this fork
# https://gist.github.com/mkajava/7515402

sunburst-shiny

Shiny bindings for sunburst

Description

Output and render functions for using sunburst within Shiny applications and interactive Rmd documents.

Usage

```
sunburstOutput(outputId, width = "100%", height = "400px")
```

```
renderSunburst(expr, env = parent.frame(), quoted = FALSE)
```

Arguments

| | |
|---------------|--|
| outputId | output variable to read from |
| width, height | Must be a valid CSS unit (like '100%', '400px', 'auto') or a number, which will be coerced to a string and have 'px' appended. |
| expr | An expression that generates a sunburst |
| env | The environment in which to evaluate expr. |
| quoted | Is expr a quoted expression (with quote())? This is useful if you want to save an expression in a variable. |

sund2b

Sunburst Using 'd2b'

Description

Create interactive sunburst chart with the 'd2b' charting library.

Usage

```

sund2b(data = NULL, colors = NULL, valueField = "size",
  tooltip = NULL, breadcrumbs = NULL, rootLabel = NULL,
  width = NULL, height = NULL, elementId = NULL)

```

Arguments

| | |
|---------------|---|
| data | data in csv source,target form or in nested d3 JSON hierarchy with 'name:..., children:[];'. list, character, or connection data will be assumed to be JSON. data.frame data will be assumed to be csvdata and converted to JSON by <code>sunburstR::csv_to_hier()</code> . |
| colors | vector of strings representing colors as hexadecimal for manual colors. If you want precise control of colors, supply a list with range and/or domain. For advanced customization, supply a JavaScript function. |
| valueField | character for the field to use to calculate size. The default value is "size". |
| tooltip | list of options for customizing the tooltip. See the helper function sund2bTooltip for more information. |
| breadcrumbs | list of options for customizing the breadcrumb. See the helper function sund2bBreadcrumb for more information. |
| rootLabel | character to label root node something other than 'root'. |
| height, width | height and width of sunburst htmlwidget containing div specified in any valid CSS size unit. |
| elementId | string id as a valid CSS element id. |

Examples

```
## Not run:

# The sund2b() API mirrors sunburst() with fewer arguments.

library(sunburstR)

# use a sample of the sequences csv data
sequences <- read.csv(
  system.file("examples/visit-sequences.csv",package="sunburstR")
  ,header = FALSE
  ,stringsAsFactors = FALSE
)[1:200,]

# create a d2b sunburst
sund2b(sequences)

# change the colors
# using d3.js categorical color scheme
sund2b(
  sequences,
  colors = htmlwidgets::JS("d3.scaleOrdinal(d3.schemeCategory20b)")
)
# using RColorBrewer palette
sund2b(
  sequences,
  colors = list(range = RColorBrewer::brewer.pal(9, "Set3"))
)
# using a color column from the R dataset
```

```

# treemap has an amazing treecolors ability
library(treemap)
library(d3r)
rhd <- random.hierarchical.data()
tm <- treemap(
  rhd,
  index = paste0("index", 1:3),
  vSize = "x",
  draw = FALSE
)$tm
sund2b(
  d3_nest(tm, value_cols = colnames(tm)[-1:3]),
  colors = htmlwidgets::JS(
    # yes this is a little different, so please pay attention
    # "function(d) {return d.color}" will not work
    "function(name, d){return d.color || '#ccc';}"
  ),
  valueField = "vSize"
)

# use sund2b in Shiny
library(shiny)
ui <- sund2bOutput("sun")
server <- function(input, output, session) {
  output$sun <- renderSund2b({
    sund2b(sequences)
  })
}
shinyApp(ui, server)

## End(Not run)

```

sund2bBreadcrumb

Advanced Customization of 'd2b' Breadcrumb

Description

Advanced Customization of 'd2b' Breadcrumb

Usage

```
sund2bBreadcrumb(enabled = NULL, html = NULL, orient = NULL)
```

Arguments

enabled boolean to enable or disable the breadcrumbs.

| | |
|--------|---|
| html | character or <code>htmlwidgets::JS</code> to customize the content of the breadcrumb. To provide a function, the arguments for the 'JavaScript' function will be 'function(nodedata, size, percent)' and the function should return a string. |
| orient | character which should be one of "top", "left", "right", "bottom" to control the orientation of the breadcrumb relative to the chart. |

Value

list

Examples

```

if(interactive()){

library(sunburstR)

# use a sample of the sequences csv data
sequences <- read.csv(
  system.file("examples/visit-sequences.csv", package="sunburstR")
  ,header = FALSE
  ,stringsAsFactors = FALSE
)[1:200,]

# disable the breadcrumb
sund2b(
  sequences,
  breadcrumbs = sund2bBreadcrumb(
    enabled = FALSE
  )
)

# change the breadcrumb content
sund2b(
  sequences,
  breadcrumbs = sund2bBreadcrumb(
    html = htmlwidgets::JS("
function(nodedata, size, percent) {
  return '<span style=\"font-weight: bold;\">>' + nodedata.name + '</span>' + ' ' + size
}
")
  )
)
}

```

Description

Advanced Customization of 'd2b' Tooltip

Usage

```
sund2bTooltip(at = NULL, followMouse = NULL, html = NULL,
             my = NULL)
```

Arguments

| | |
|-------------|--|
| at | character which should be one of "top left", "top center", "top right", "center left", "center center", "center right", "bottom center", "bottom right" to specify where the tooltip will be positioned relative to the hovered item. |
| followMouse | logical controlling whether the tooltip will follow the mouse instead of being placed in a static position relative to the hovered element |
| html | character or <code>htmlwidgets::JS</code> to customize the content of the tooltip. To provide a function, the arguments for the 'JavaScript' function will be 'function(nodedata, size, percent)' and the function should return a string. |
| my | character which should be one of "top", "left", "right", "bottom" to control the orientation of the tooltip. |

Value

list

Examples

```
if(interactive()){
  library(sunburstR)

  # use a sample of the sequences csv data
  sequences <- read.csv(
    system.file("examples/visit-sequences.csv", package="sunburstR")
    ,header = FALSE
    ,stringsAsFactors = FALSE
  )[1:200,]

  # change the tooltip
  sund2b(
    sequences,
    tooltip = sund2bTooltip(
      html = htmlwidgets::JS("
function(nodedata, size, percent) {
  return '<span style=\"font-weight: bold;\">' + nodedata.name + '</span>' + ' ' + size
}
")
    )
  )
}
```

}
