

# Package ‘GGally’

March 25, 2020

**Version** 1.5.0

**License** GPL (>= 2.0)

**Title** Extension to 'ggplot2'

**Type** Package

**LazyLoad** yes

**LazyData** true

**URL** <https://ggobi.github.io/ggally>, <https://github.com/ggobi/ggally>

**BugReports** <https://github.com/ggobi/ggally/issues>

**Description** The R package 'ggplot2' is a plotting system based on the grammar of graphics. 'GGally' extends 'ggplot2' by adding several functions to reduce the complexity of combining geometric objects with transformed data. Some of these functions include a pairwise plot matrix, a two group pairwise plot matrix, a parallel coordinates plot, a survival plot, and several functions to plot networks.

**Depends** R (>= 3.1), ggplot2 (> 2.2.0)

**Imports** grDevices, grid, gtable (>= 0.2.0), plyr (>= 1.8.3), progress, RColorBrewer, reshape (>= 0.8.5), utils, rlang

**Suggests** broom (>= 0.4.0), chemometrics, geosphere (>= 1.5-1), igraph (>= 1.0.1), intergraph (>= 2.0-2), maps (>= 3.1.0), mapproj, network (>= 1.12.0), scagnostics, scales (>= 0.4.0), sna (>= 2.3-2), survival, packagedocs (>= 0.4.0), rmarkdown, roxygen2, testthat, crosstalk

**RoxygenNote** 7.1.0

**VignetteBuilder** packagedocs

**SystemRequirements** openssl

**Encoding** UTF-8

**NeedsCompilation** no

**Author** Barret Schloerke [aut, cre] (author for ggpairs, ggduo, ggnostic, ggts, ggfacet, and ggally\_\*. Contributor for all functions.), Jason Crowley [aut] (ggparcoord),

Di Cook [aut, ths] (ggscatmat, gglyph),  
 Heike Hofmann [ths],  
 Hadley Wickham [ths],  
 Francois Briatte [aut] (ggcorr, ggnet, ggnet2),  
 Moritz Marbach [aut] (ggnet, ggnet2),  
 Edwin Thoen [aut] (ggsurv),  
 Amos Elberg [aut] (ggnetworkmap),  
 Joseph Larmarange [aut] (ggcoef),  
 Ott Toomet [ctb]

**Maintainer** Barret Schloerke <schloerke@gmail.com>

**Repository** CRAN

**Date/Publication** 2020-03-25 18:20:15 UTC

`+.gg`*Modify a ggmatrix object by adding an ggplot2 object to all plots*

---

## Description

This operator allows you to add ggplot2 objects to a ggmatrix object.

## Usage

```
## S3 method for class 'gg'  
e1 + e2
```

## Arguments

e1	An object of class ggplot or theme
e2	A component to add to e1

## Details

If the first object is an object of class ggmatrix, you can add the following types of objects, and it will return a modified ggplot object.

- theme: update plot theme

The + operator completely replaces elements with elements from e2.

## See Also

[+.gg](#) and [theme](#)

## Examples

```
data(tips, package = "reshape")  
pm <- ggpairs(tips[, 2:3])  
## change to black and white theme  
pm + ggplot2::theme_bw()  
## change to linedraw theme  
# pm + ggplot2::theme_linedraw()  
## change to custom theme  
# pm + ggplot2::theme(panel.background = ggplot2::element_rect(fill = "lightblue"))  
## add a list of information  
extra <- list(ggplot2::theme_bw(), ggplot2::labs(caption = "My caption!"))  
pm + extra
```

---

add_ref_boxes	<i>Add reference boxes around each cell of the glyphmap.</i>
---------------	--

---

**Description**

Add reference boxes around each cell of the glyphmap.

**Usage**

```
add_ref_boxes(
  data,
  var_fill = NULL,
  color = "white",
  size = 0.5,
  fill = NA,
  ...
)
```

**Arguments**

data	A glyphmap structure.
var_fill	Variable name to use to set the fill color
color	Set the color to draw in, default is "white"
size	Set the line size, default is 0.5
fill	fill value used if var_fill is NULL
...	other arguments passed onto <a href="#">geom_rect</a>

---

add_ref_lines	<i>Add reference lines for each cell of the glyphmap.</i>
---------------	---

---

**Description**

Add reference lines for each cell of the glyphmap.

**Usage**

```
add_ref_lines(data, color = "white", size = 1.5, ...)
```

**Arguments**

data	A glyphmap structure.
color	Set the color to draw in, default is "white"
size	Set the line size, default is 1.5
...	other arguments passed onto <a href="#">geom_line</a>

---

australia\_PISA2012      *Programme for International Student Assessment (PISA) 2012 Data for Australia*

---

## Description

About PISA

## Usage

```
data(australia_PISA2012)
```

## Format

A data frame with 8247 rows and 32 variables

## Details

The Programme for International Student Assessment (PISA) is a triennial international survey which aims to evaluate education systems worldwide by testing the skills and knowledge of 15-year-old students. To date, students representing more than 70 economies have participated in the assessment.

While 65 economies took part in the 2012 study, this data set only contains information from the country of Australia.

---

brew\_colors

*RColorBrewer Set1 colors*

---

### Description

RColorBrewer Set1 colors

### Usage

```
brew_colors(col)
```

### Arguments

col                    standard color name used to retrieve hex color value

---

broomify	<i>Broomify a model</i>
----------	-------------------------

---

### Description

broom::augment a model and add broom::glance and broom::tidy output as attributes. X and Y variables are also added.

### Usage

```
broomify(model, lmStars = TRUE)
```

### Arguments

model	model to be sent to broom::augment, broom::glance, and broom::tidy
lmStars	boolean that determines if stars are added to labels

### Value

broom::augmented data frame with the broom::glance data.frame and broom::tidy data.frame as 'broom\_glance' and 'broom\_tidy' attributes respectively. var\_x and var\_y variables are also added as attributes

### Examples

```
data(mtcars)
model <- stats::lm(mpg ~ wt + qsec + am, data = mtcars)
broomified_model <- broomify(model)
str(broomified_model)
```

---

eval_data_col	<i>Evaluate data column</i>
---------------	-----------------------------

---

### Description

Evaluate data column

### Usage

```
eval_data_col(data, aes_col)
```

### Arguments

data	data set to evaluate the data with
aes_col	Single value from an ggplot2::aes(...) object

**Value**

Aes mapping with the x and y values switched

**Examples**

```
mapping <- ggplot2::aes(Petal.Length)
eval_data_col(iris, mapping$x)
```

---

find_plot_type	<i>Find Plot Types</i>
----------------	------------------------

---

**Description**

Retrieves the type of plot for the specific columns

**Usage**

```
find_plot_type(col1Name, col2Name, type1, type2, isAllNa, allowDiag)
```

**Arguments**

col1Name	x column name
col2Name	y column name
type1	x column type
type2	y column type
isAllNa	is.na(data)
allowDiag	allow for diag values to be returned

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

---

flea	<i>Historical data used for classification examples.</i>
------	--

---

**Description**

This data contains physical measurements on three species of flea beetles.

**Usage**

```
data(flea)
```

**Format**

A data frame with 74 rows and 7 variables

**Details**

- species Ch. concinna, Ch. heptapotamica, Ch. heikertingeri
- tars1 width of the first joint of the first tarsus in microns
- tars2 width of the second joint of the first tarsus in microns
- head the maximal width of the head between the external edges of the eyes in 0.01 mm
- aede1 the maximal width of the aedeagus in the fore-part in microns
- aede2 the front angle of the aedeagus (1 unit = 7.5 degrees)
- aede3 the aedeagus width from the side in microns

---

 fn\_switch

*Function switch*

---

**Description**

Function that allows you to call different functions based upon an aesthetic variable value.

**Usage**

```
fn_switch(types, mapping_val = "y")
```

**Arguments**

types	list of functions that follow the ggmatrix function standard: <code>function(data, mapping, ...){ #make ggplot2 object }</code> . One key should be a 'default' key for a default switch case.
mapping_val	mapping value to switch on. Defaults to the 'y' variable of the aesthetics list.

**Examples**

```
ggnostic_continuous_fn <- fn_switch(list(
  default = ggally_points,
  .fitted = ggally_points,
  .se.fit = ggally_nostic_se_fit,
  .resid = ggally_nostic_resid,
  .hat = ggally_nostic_hat,
  .sigma = ggally_nostic_sigma,
  .cooksd = ggally_nostic_cooksd,
```

```
.std.resid = ggally_nostic_std_resid
))

ggnostic_combo_fn <- fn_switch(list(
  default = ggally_box_no_facet,
  fitted = ggally_box_no_facet,
  .se.fit = ggally_nostic_se_fit,
  .resid = ggally_nostic_resid,
  .hat = ggally_nostic_hat,
  .sigma = ggally_nostic_sigma,
  .cooksd = ggally_nostic_cooksd,
  .std.resid = ggally_nostic_std_resid
))
```

---

getPlot

*getPlot*

---

## Description

Retrieves the ggplot object at the desired location.

## Usage

```
getPlot(pm, i, j)

## S3 method for class 'ggmatrix'
pm[i, j, ...]
```

## Arguments

pm	ggmatrix object to select from
i	row from the top
j	column from the left
...	ignored

## Author(s)

Barret Schloerke <schloerke@gmail.com>

## Examples

```
data(tips, package = "reshape")
plotMatrix2 <- ggpairs(tips[, 3:2], upper = list(combo = "denstrip"))
plotMatrix2[1, 2]
```

---

ggally\_barDiag      *Plots the Bar Plots by Using Diagonal*

---

**Description**

Plots the bar plots by using Diagonal.

**Usage**

```
ggally_barDiag(data, mapping, ..., rescale = FALSE)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	other arguments are sent to geom_bar
rescale	boolean to decide whether or not to rescale the count output. Only applies to numeric data

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_barDiag(tips, mapping = ggplot2::aes(x = day))
ggally_barDiag(tips, mapping = ggplot2::aes(x = tip), binwidth = 0.25)
```

---

ggally\_blank      *Blank*

---

**Description**

Draws nothing.

**Usage**

```
ggally_blank(...)
ggally_blankDiag(...)
```

**Arguments**

...	other arguments ignored
-----	-------------------------

**Details**

Makes a "blank" ggplot object that will only draw white space

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

---

ggally\_box

*Plots the Box Plot*

---

**Description**

Make a box plot with a given data set. `ggally_box_no_facet` will be a single panel plot, while `ggally_box` will be a faceted plot

**Usage**

```
ggally_box(data, mapping, ...)
```

```
ggally_box_no_facet(data, mapping, ...)
```

**Arguments**

<code>data</code>	data set using
<code>mapping</code>	aesthetics being used
<code>...</code>	other arguments being supplied to <code>geom_boxplot</code>

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_box(tips, mapping = ggplot2::aes(x = total_bill, y = sex))
ggally_box(tips, mapping = ggplot2::aes_string(x = "total_bill", y = "sex"))
ggally_box(
  tips,
  mapping      = ggplot2::aes_string(y = "total_bill", x = "sex", color = "sex"),
  outlier.colour = "red",
  outlier.shape = 13,
  outlier.size  = 8
)
```

---

`ggally_cor`*Correlation from the Scatter Plot*

---

**Description**

Estimate correlation from the given data.

**Usage**

```
ggally_cor(  
  data,  
  mapping,  
  alignPercent = 0.6,  
  method = "pearson",  
  use = "complete.obs",  
  corAlignPercent = NULL,  
  corMethod = NULL,  
  corUse = NULL,  
  displayGrid = TRUE,  
  ...  
)
```

**Arguments**

<code>data</code>	data set using
<code>mapping</code>	aesthetics being used
<code>alignPercent</code>	right align position of numbers. Default is 60 percent across the horizontal
<code>method</code>	method supplied to cor function
<code>use</code>	use supplied to cor function
<code>corAlignPercent</code>	deprecated. Use parameter <code>alignPercent</code>
<code>corMethod</code>	deprecated. Use parameter <code>method</code>
<code>corUse</code>	deprecated. Use parameter <code>use</code>
<code>displayGrid</code>	if TRUE, display aligned panel gridlines
<code>...</code>	other arguments being supplied to <code>geom_text</code>

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

## Examples

```
data(tips, package = "reshape")
ggally_cor(tips, mapping = ggplot2::aes_string(x = "total_bill", y = "tip"))
# display with no grid
ggally_cor(
  tips,
  mapping = ggplot2::aes_string(x = "total_bill", y = "tip"),
  displayGrid = FALSE
)
# change text attributes
ggally_cor(
  tips,
  mapping = ggplot2::aes(x = total_bill, y = tip),
  size = 15,
  colour = I("red")
)
# split by a variable
ggally_cor(
  tips,
  mapping = ggplot2::aes_string(x = "total_bill", y = "tip", color = "sex"),
  size = 5
)
```

---

ggally\_density

*Plots the Scatter Density Plot*

---

## Description

Make a scatter density plot from a given data.

## Usage

```
ggally_density(data, mapping, ...)
```

## Arguments

data	data set using
mapping	aesthetics being used
...	parameters sent to either stat_density2d or geom_density2d

## Details

The aesthetic "fill" determines whether or not stat\_density2d (filled) or geom\_density2d (lines) is used.

## Author(s)

Barret Schloerke <schloerke@gmail.com>

**Examples**

```

data(tips, package = "reshape")
ggally_density(tips, mapping = ggplot2::aes(x = total_bill, y = tip))
ggally_density(tips, mapping = ggplot2::aes_string(x = "total_bill", y = "tip"))
ggally_density(
  tips,
  mapping = ggplot2::aes_string(x = "total_bill", y = "tip", fill = "..level..")
)
ggally_density(
  tips,
  mapping = ggplot2::aes_string(x = "total_bill", y = "tip", fill = "..level..")
) + ggplot2::scale_fill_gradient(breaks = c(0.05, 0.1, 0.15, 0.2))

```

---

ggally\_densityDiag     *Plots the Density Plots by Using Diagonal*

---

**Description**

Plots the density plots by using Diagonal.

**Usage**

```
ggally_densityDiag(data, mapping, ..., rescale = FALSE)
```

**Arguments**

data	data set using
mapping	aesthetics being used.
...	other arguments sent to stat_density
rescale	boolean to decide whether or not to rescale the count output

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```

data(tips, package = "reshape")
ggally_densityDiag(tips, mapping = ggplot2::aes(x = total_bill))
ggally_densityDiag(tips, mapping = ggplot2::aes(x = total_bill, color = day))

```

---

ggally_denstrip	<i>Plots a tile plot with facets</i>
-----------------	--------------------------------------

---

**Description**

Make Tile Plot as densely as possible.

**Usage**

```
ggally_denstrip(data, mapping, ...)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	other arguments being sent to stat_bin

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_denstrip(tips, mapping = ggplot2::aes(x = total_bill, y = sex))
ggally_denstrip(tips, mapping = ggplot2::aes_string(x = "total_bill", y = "sex"))
ggally_denstrip(
  tips,
  mapping = ggplot2::aes_string(x = "sex", y = "tip", binwidth = "0.2")
) + ggplot2::scale_fill_gradient(low = "grey80", high = "black")
```

---

ggally_diagAxis	<i>Internal Axis Labeling Plot for ggpairs</i>
-----------------	--

---

**Description**

This function is used when axisLabels == "internal".

**Usage**

```
ggally_diagAxis(
  data,
  mapping,
  label = mapping$x,
  labelSize = 5,
  labelXPercent = 0.5,
  labelYPercent = 0.55,
  labelHJust = 0.5,
  labelVJust = 0.5,
  gridLabelSize = 4,
  ...
)
```

**Arguments**

data	dataset being plotted
mapping	aesthetics being used (x is the variable the plot will be made for)
label	title to be displayed in the middle. Defaults to mapping\$x
labelSize	size of variable label
labelXPercent	percent of horizontal range
labelYPercent	percent of vertical range
labelHJust	hjust supplied to label
labelVJust	vjust supplied to label
gridLabelSize	size of grid labels
...	other arguments for geom_text

**Author(s)**

Jason Crowley <crowley.jason.s@gmail.com> and Barret Schloerke

**Examples**

```
data(tips, package = "reshape")
ggally_diagAxis(tips, ggplot2::aes(x=tip))
ggally_diagAxis(tips, ggplot2::aes(x=sex))
```

---

ggally\_dot

*Plots the Box Plot with Dot*

---

**Description**

Add jittering with the box plot. `ggally_dot_no_facet` will be a single panel plot, while `ggally_dot` will be a faceted plot

**Usage**

```
ggally_dot(data, mapping, ...)

ggally_dot_no_facet(data, mapping, ...)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	other arguments being supplied to geom_jitter

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_dot(tips, mapping = ggplot2::aes(x = total_bill, y = sex))
ggally_dot(tips, mapping = ggplot2::aes_string(x = "total_bill", y = "sex"))
ggally_dot(
  tips,
  mapping = ggplot2::aes_string(y = "total_bill", x = "sex", color = "sex")
)
ggally_dot(
  tips,
  mapping = ggplot2::aes_string(y = "total_bill", x = "sex", color = "sex", shape = "sex")
) + ggplot2::scale_shape(solid=FALSE)
```

---

ggally\_dot\_and\_box      *Plots either Box Plot or Dot Plots*

---

**Description**

Place box plots or dot plots on the graph

**Usage**

```
ggally_dot_and_box(data, mapping, ..., boxPlot = TRUE)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	parameters passed to either geom_jitter or geom_boxplot
boxPlot	boolean to decide to plot either box plots (TRUE) or dot plots (FALSE)

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_dot_and_box(
  tips,
  mapping = ggplot2::aes(x = total_bill, y = sex, color = sex),
  boxPlot = TRUE
)
ggally_dot_and_box(
  tips,
  mapping = ggplot2::aes(x = total_bill, y = sex, color = sex),
  boxPlot = FALSE
)
```

---

ggally\_facetbar

*Plots the Bar Plots Faceted by Conditional Variable*

---

**Description**

X variables are plotted using `geom_bar` and faceted by the Y variable.

**Usage**

```
ggally_facetbar(data, mapping, ...)
```

**Arguments**

<code>data</code>	data set using
<code>mapping</code>	aesthetics being used
<code>...</code>	other arguments are sent to <code>geom_bar</code>

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_facetbar(tips, ggplot2::aes(x = sex, y = smoker, fill = time))
ggally_facetbar(tips, ggplot2::aes(x = smoker, y = sex, fill = time))
```

---

ggally\_facetdensity *Plots the density plots by faceting*

---

**Description**

Make density plots by displaying subsets of the data in different panels.

**Usage**

```
ggally_facetdensity(data, mapping, ...)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	other arguments being sent to stat_density

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_facetdensity(tips, mapping = ggplot2::aes(x = total_bill, y = sex))
ggally_facetdensity(
  tips,
  mapping = ggplot2::aes_string(y = "total_bill", x = "sex", color = "sex")
)
```

---

ggally\_facetdensitystrip *Plots a density plot with facets or a tile plot with facets*

---

**Description**

Make Tile Plot as densely as possible.

**Usage**

```
ggally_facetdensitystrip(data, mapping, ..., den_strip = FALSE)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	other arguments being sent to either geom_histogram or stat_density
den_strip	boolean to decide whether or not to plot a density strip(TRUE) or a facet density(FALSE) plot.

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
example(ggally_facetdensity)
example(ggally_denstrip)
```

---

ggally\_facethist      *Plots the Histograms by Faceting*

---

**Description**

Make histograms by displaying subsets of the data in different panels.

**Usage**

```
ggally_facethist(data, mapping, ...)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	parameters sent to stat_bin()

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_facethist(tips, mapping = ggplot2::aes(x = tip, y = sex))
ggally_facethist(tips, mapping = ggplot2::aes_string(x = "tip", y = "sex"), binwidth = 0.1)
```

---

ggally_na	<i>NA plot</i>
-----------	----------------

---

**Description**

Draws a large NA in the middle of the plotting area. This plot is useful when all X or Y data is NA

**Usage**

```
ggally_na(data = NULL, mapping = NULL, size = 10, color = "grey20", ...)
ggally_naDiag(...)
```

**Arguments**

data	ignored
mapping	ignored
size	size of the geom_text 'NA'
color	color of the geom_text 'NA'
...	other arguments sent to geom_text

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

---

ggally_nostic_cooksd	<i>ggnostic - Cook's distance</i>
----------------------	-----------------------------------

---

**Description**

A function to display stats: `cooks.distance`.

**Usage**

```
ggally_nostic_cooksd(
  data,
  mapping,
  ...,
  linePosition = pf(0.5, length(attr(data, "var_x")), nrow(data) - length(attr(data,
    "var_x"))),
  lineColor = brew_colors("grey"),
  lineType = 2
)
```

**Arguments**

data, mapping, ..., lineColor, lineType  
 parameters supplied to [ggally\\_nostic\\_line](#)  
 linePosition 4 / n is the general cutoff point for Cook's Distance

**Details**

A line is added at  $F_p, n - p(0.5)$  to display the general cutoff point for Cook's Distance.

Reference: Michael H. Kutner, Christopher J. Nachtsheim, John Neter, and William Li. Applied linear statistical models. The McGraw-Hill / Irwin series operations and decision sciences. McGraw-Hill Irwin, 2005, p. 403

**Value**

ggplot2 plot object

**See Also**

[stats::cooks.distance](#)

**Examples**

```
dt <- broomify(stats::lm(mpg ~ wt + qsec + am, data = mtcars))
ggally_nostic_cooksd(dt, ggplot2::aes(wt, .cooks_d))
```

---

ggally\_nostic\_hat      *ggnostic - leverage points*

---

**Description**

A function to display `stats::influence`'s hat information against a given explanatory variable.

**Usage**

```
ggally_nostic_hat(
  data,
  mapping,
  ...,
  linePosition = 2 * sum(eval_data_col(data, mapping$y))/nrow(data),
  lineColor = brew_colors("grey"),
  lineSize = 0.5,
  lineAlpha = 1,
  lineType = 2,
  avgLinePosition = sum(eval_data_col(data, mapping$y))/nrow(data),
  avgLineColor = brew_colors("grey"),
  avgLineSize = lineSize,
  avgLineAlpha = lineAlpha,
  avgLineType = 1
)
```

**Arguments**

data, mapping, ...  
 supplied directly to `ggally_nostic_line`

linePosition, lineColor, lineSize, lineAlpha, lineType  
 parameters supplied to `ggplot2::geom_line` for the cutoff line

avgLinePosition, avgLineColor, avgLineSize, avgLineAlpha, avgLineType  
 parameters supplied to `ggplot2::geom_line` for the average line

**Details**

As stated in `stats::influence` documentation:

hat: a vector containing the diagonal of the 'hat' matrix.

The diagonal elements of the 'hat' matrix describe the influence each response value has on the fitted value for that same observation.

A suggested "cutoff" line is added to the plot at a height of  $2 * p / n$  and an expected line at a height of  $p / n$ . If either `linePosition` or `avgLinePosition` is NULL, the respective line will not be drawn.

**Value**

ggplot2 plot object

**See Also**

`stats::influence`

**Examples**

```
dt <- broomify(stats::lm(mpg ~ wt + qsec + am, data = mtcars))
ggally_nostic_hat(dt, ggplot2::aes(wt, .hat))
```

---

`ggally_nostic_line`      *ggnostic -background line with geom*

---

**Description**

If a non-null `linePosition` value is given, a line will be drawn before the given `continuous_geom` or `combo_geom` is added to the plot.

**Usage**

```
ggally_nostic_line(  
  data,  
  mapping,  
  ...,  
  linePosition = NULL,  
  lineColor = "red",
```

```

    lineSize = 0.5,
    lineAlpha = 1,
    lineType = 1,
    continuous_geom = ggplot2::geom_point,
    combo_geom = ggplot2::geom_boxplot,
    mapColorToFill = TRUE
  )

```

### Arguments

`data`, `mapping` supplied directly to `ggplot2::ggplot(data, mapping)`

`...` parameters supplied to `continuous_geom` or `combo_geom`

`linePosition`, `lineColor`, `lineSize`, `lineAlpha`, `lineType`  
parameters supplied to `ggplot2::geom_line`

`continuous_geom`  
ggplot2 geom that is executed after the line is (possibly) added and if the x data is continuous

`combo_geom`  
ggplot2 geom that is executed after the line is (possibly) added and if the x data is discrete

`mapColorToFill` boolean to determine if combo plots should cut the color mapping to the fill mapping

### Details

Functions with a color in their name have different default color behavior.

### Value

ggplot2 plot object

---

ggally\_nostic\_resid    *ggnostic - residuals*

---

### Description

If non-null `pVal` and `sigma` values are given, confidence interval lines will be added to the plot at the specified `pVal` percentiles of a  $N(0, \sigma)$  distribution.

### Usage

```

ggally_nostic_resid(
  data,
  mapping,
  ...,
  linePosition = 0,
  lineColor = brew_colors("grey"),

```

```

    lineSize = 0.5,
    lineAlpha = 1,
    lineType = 1,
    lineConfColor = brew_colors("grey"),
    lineConfSize = lineSize,
    lineConfAlpha = lineAlpha,
    lineConfType = 2,
    pVal = c(0.025, 0.975),
    sigma = attr(data, "broom_glance")$sigma,
    se = TRUE,
    method = "auto",
    formula = y ~ x
  )

```

### Arguments

data, mapping, ...  
     parameters supplied to [ggally\\_nostic\\_line](#)  
 linePosition, lineColor, lineSize, lineAlpha, lineType  
     parameters supplied to `ggplot2::geom_line`  
 lineConfColor, lineConfSize, lineConfAlpha, lineConfType  
     parameters supplied to the confidence interval lines  
 pVal  
     percentiles of a  $N(0, \text{sigma})$  distribution to be drawn  
 sigma  
     sigma value for the pVal percentiles  
 se  
     boolean to determine if the confidence intervals should be displayed  
 method, formula  
     parameters supplied to `ggplot2::geom_smooth`. Defaults to "auto" and "y ~ x"

### Value

ggplot2 plot object

### See Also

[stats::residuals](#)

### Examples

```

dt <- broomify(stats::lm(mpg ~ wt + qsec + am, data = mtcars))
ggally_nostic_resid(dt, ggplot2::aes(wt, .resid))

```

---

ggally\_nostic\_se\_fit *ggnostic - fitted value standard error*

---

## Description

A function to display `stats::predict`'s standard errors

## Usage

```
ggally_nostic_se_fit(  
  data,  
  mapping,  
  ...,  
  lineColor = brew_colors("grey"),  
  linePosition = NULL  
)
```

## Arguments

`data`, `mapping`, `...`, `lineColor`  
parameters supplied to [ggally\\_nostic\\_line](#)

`linePosition` base comparison for a perfect fit

## Details

As stated in `stats::predict` documentation:

If the logical 'se.fit' is 'TRUE', standard errors of the predictions are calculated. If the numeric argument 'scale' is set (with optional 'df'), it is used as the residual standard deviation in the computation of the standard errors, otherwise this is extracted from the model fit.

Since the se.fit is TRUE and scale is unset by default, the standard errors are extracted from the model fit.

A base line of 0 is added to give reference to a perfect fit.

## Value

ggplot2 plot object

## See Also

`stats::influence`

## Examples

```
dt <- broomify(stats::lm(mpg ~ wt + qsec + am, data = mtcars))  
ggally_nostic_se_fit(dt, ggplot2::aes(wt, .se.fit))
```

---

ggally\_nostic\_sigma    *ggnostic - leave one out model sigma*

---

## Description

A function to display `stats::influence`'s sigma value.

## Usage

```
ggally_nostic_sigma(  
  data,  
  mapping,  
  ...,  
  lineColor = brew_colors("grey"),  
  linePosition = attr(data, "broom_glance")$sigma  
)
```

## Arguments

`data`, `mapping`, `...`, `lineColor`  
parameters supplied to [ggally\\_nostic\\_line](#)

`linePosition`    line that is drawn in the background of the plot. Defaults to the overall model's sigma value.

## Details

As stated in `stats::influence` documentation:

`sigma`: a vector whose *i*-th element contains the estimate of the residual standard deviation obtained when the *i*-th case is dropped from the regression. (The approximations needed for GLMs can result in this being 'NaN'.)

A line is added to display the overall model's sigma value. This gives a baseline for comparison

## Value

ggplot2 plot object

## See Also

`stats::influence`

## Examples

```
dt <- broomify(stats::lm(mpg ~ wt + qsec + am, data = mtcars))  
ggally_nostic_sigma(dt, ggplot2::aes(wt, .sigma))
```

ggally\_nostic\_std\_resid

*ggnostic - standardized residuals*

---

### Description

If non-null pVal and sigma values are given, confidence interval lines will be added to the plot at the specified pVal locations of a  $N(0, 1)$  distribution.

### Usage

```
ggally_nostic_std_resid(data, mapping, ..., sigma = 1)
```

### Arguments

data, mapping, ...

parameters supplied to [ggally\\_nostic\\_resid](#)

sigma

sigma value for the pVal percentiles. Set to 1 for standardized residuals

### Value

ggplot2 plot object

### See Also

[stats::rstandard](#)

### Examples

```
dt <- broomify(stats::lm(mpg ~ wt + qsec + am, data = mtcars))
ggally_nostic_std_resid(dt, ggplot2::aes(wt, .std.resid))
```

---

ggally\_points

*Plots the Scatter Plot*

---

### Description

Make a scatter plot with a given data set.

### Usage

```
ggally_points(data, mapping, ...)
```

**Arguments**

data	data set using
mapping	aesthetics being used
...	other arguments are sent to geom_point

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(mtcars)
ggally_points(mtcars, mapping = ggplot2::aes(x = disp, y = hp))
ggally_points(mtcars, mapping = ggplot2::aes_string(x = "disp", y = "hp"))
ggally_points(
  mtcars,
  mapping = ggplot2::aes_string(
    x = "disp",
    y = "hp",
    color = "as.factor(cyl)",
    size = "gear"
  )
)
```

---

ggally\_ratio

*Plots a mosaic plot*

---

**Description**

Plots the mosaic plot by using fluctuation.

**Usage**

```
ggally_ratio(
  data,
  mapping = do.call(ggplot2::aes_string, as.list(colnames(data)[1:2])),
  ...,
  floor = 0,
  ceiling = NULL
)
```

**Arguments**

data	data set using
mapping	aesthetics being used. Only x and y will used and both are required
...	passed to <a href="#">geom_tile(...)</a>
floor	don't display cells smaller than this value
ceiling	max value to scale frequencies. If any frequency is larger than the ceiling, the fill color is displayed darker than other rectangles

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_ratio(tips, ggplot2::aes(sex, day))
ggally_ratio(tips, ggplot2::aes(sex, day)) + ggplot2::coord_equal()
# only plot tiles greater or equal to 20 and scale to a max of 50
ggally_ratio(
  tips, ggplot2::aes(sex, day),
  floor = 20, ceiling = 50
) + ggplot2::theme(aspect.ratio = 4/2)
```

---

ggally\_smooth

*Plots the Scatter Plot with Smoothing*

---

**Description**

Add a smoothed condition mean with a given scatter plot.

**Usage**

```
ggally_smooth(
  data,
  mapping,
  ...,
  method = "lm",
  formula = y ~ x,
  se = TRUE,
  shrink = TRUE
)

ggally_smooth_loess(data, mapping, ...)

ggally_smooth_lm(data, mapping, ...)
```

**Arguments**

data	data set using
mapping	aesthetics being used
method, se	parameters supplied to <a href="#">geom_smooth</a>
formula, ...	other arguments to add to <a href="#">geom_smooth</a>
shrink	boolean to determine if y range is reduced to range of points or points and error ribbon

**Details**

Y limits are reduced to match original Y range with the goal of keeping the Y axis the same across plots.

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
data(tips, package = "reshape")
ggally_smooth(tips, mapping = ggplot2::aes(x = total_bill, y = tip))
ggally_smooth(tips, mapping = ggplot2::aes_string(x = "total_bill", y = "tip"))
ggally_smooth(tips, mapping = ggplot2::aes_string(x = "total_bill", y = "tip", color = "sex"))
```

---

ggally\_text

*Text Plot*

---

**Description**

Plot text for a plot.

**Usage**

```
ggally_text(
  label,
  mapping = ggplot2::aes(color = "black"),
  xP = 0.5,
  yP = 0.5,
  xrange = c(0, 1),
  yrange = c(0, 1),
  ...
)
```

**Arguments**

label	text that you want to appear
mapping	aesthetics that don't relate to position (such as color)
xP	horizontal position percentage
yP	vertical position percentage
xrange	range of the data around it. Only nice to have if plotting in a matrix
yrange	range of the data around it. Only nice to have if plotting in a matrix
...	other arguments for geom_text

**Author(s)**

Barret Schloerke <schloerke@gmail.com>

**Examples**

```
ggally_text("Example 1")
ggally_text("Example\nTwo", mapping = ggplot2::aes(size = 15), color = I("red"))
```

ggcoef

*ggcoef - Plot Model Coefficients with broom and ggplot2***Description**

Plot the coefficients of a model with **broom** and **ggplot2**.

**Usage**

```
ggcoef(
  x,
  mapping = aes_string(y = "term", x = "estimate"),
  conf.int = TRUE,
  conf.level = 0.95,
  exponentiate = FALSE,
  exclude_intercept = FALSE,
  vline = TRUE,
  vline_intercept = "auto",
  vline_color = "gray50",
  vline_linetype = "dotted",
  vline_size = 1,
  errorbar_color = "gray25",
  errorbar_height = 0,
  errorbar_linetype = "solid",
  errorbar_size = 0.5,
  sort = c("none", "ascending", "decending"),
  ...
)
```

**Arguments**

x	a model object to be tidied with <a href="#">tidy</a> or a data frame (see Details)
mapping	default aesthetic mapping
conf.int	display confidence intervals as error bars?
conf.level	level of confidence intervals (passed to <a href="#">tidy</a> if x is not a data frame)
exponentiate	if TRUE, x-axis will be logarithmic (also passed to <a href="#">tidy</a> if x is not a data frame)
exclude_intercept	should the intercept be excluded from the plot?
vline	print a vertical line?
vline_intercept	xintercept for the vertical line. "auto" for x = 0 (or x = 1 if exponentiate is TRUE)

`vline_color` color of the vertical line  
`vline_linetype` line type of the vertical line  
`vline_size` size of the vertical line  
`errorbar_color` color of the error bars  
`errorbar_height` height of the error bars  
`errorbar_linetype` line type of the error bars  
`errorbar_size` size of the error bars  
`sort` "none" (default) do not sort, "ascending" sort by increasing coefficient value, or "decending" sort by decreasing coefficient value  
`...` additional arguments sent to `geom_point`

### Examples

```

library(broom)
reg <- lm(Sepal.Length ~ Sepal.Width + Petal.Length + Petal.Width, data = iris)
ggcoef(reg)
d <- as.data.frame(Titanic)
reg2 <- glm(Survived ~ Sex + Age + Class, family = binomial, data = d, weights = d$Freq)
ggcoef(reg2, exponentiate = TRUE)
ggcoef(
  reg2, exponentiate = TRUE, exclude_intercept = TRUE,
  errorbar_height = .2, color = "blue", sort = "ascending"
)

```

---

ggcorr

*ggcorr - Plot a correlation matrix with ggplot2*

---

### Description

Function for making a correlation matrix plot, using ggplot2. The function is directly inspired by Tian Zheng and Yu-Sung Su's `corrplot` function in the 'arm' package. Please visit <http://github.com/briatte/ggcorr> for the latest version of `ggcorr`, and see the vignette at <https://briatte.github.io/ggcorr/> for many examples of how to use it.

### Usage

```

ggcorr(
  data,
  method = c("pairwise", "pearson"),
  cor_matrix = NULL,
  nbreaks = NULL,
  digits = 2,
  name = "",
  low = "#3B9AB2",

```

```

mid = "#EEEEEE",
high = "#F21A00",
midpoint = 0,
palette = NULL,
geom = "tile",
min_size = 2,
max_size = 6,
label = FALSE,
label_alpha = FALSE,
label_color = "black",
label_round = 1,
label_size = 4,
limits = c(-1, 1),
drop = is.null(limits) || identical(limits, FALSE),
layout.exp = 0,
legend.position = "right",
legend.size = 9,
...
)

```

### Arguments

<code>data</code>	a data frame or matrix containing numeric (continuous) data. If any of the columns contain non-numeric data, they will be dropped with a warning.
<code>method</code>	a vector of two character strings. The first value gives the method for computing covariances in the presence of missing values, and must be (an abbreviation of) one of "everything", "all.obs", "complete.obs", "na.or.complete" or "pairwise.complete.obs". The second value gives the type of correlation coefficient to compute, and must be one of "pearson", "kendall" or "spearman". See <code>cor</code> for details. Defaults to <code>c("pairwise", "pearson")</code> .
<code>cor_matrix</code>	the named correlation matrix to use for calculations. Defaults to the correlation matrix of data when data is supplied.
<code>nbreaks</code>	the number of breaks to apply to the correlation coefficients, which results in a categorical color scale. See 'Note'. Defaults to <code>NULL</code> (no breaks, continuous scaling).
<code>digits</code>	the number of digits to show in the breaks of the correlation coefficients: see <code>cut</code> for details. Defaults to 2.
<code>name</code>	a character string for the legend that shows the colors of the correlation coefficients. Defaults to "" (no legend name).
<code>low</code>	the lower color of the gradient for continuous scaling of the correlation coefficients. Defaults to "#3B9AB2" (blue).
<code>mid</code>	the midpoint color of the gradient for continuous scaling of the correlation coefficients. Defaults to "#EEEEEE" (very light grey).
<code>high</code>	the upper color of the gradient for continuous scaling of the correlation coefficients. Defaults to "#F21A00" (red).
<code>midpoint</code>	the midpoint value for continuous scaling of the correlation coefficients. Defaults to 0.

palette	if nbreaks is used, a ColorBrewer palette to use instead of the colors specified by low, mid and high. Defaults to NULL.
geom	the geom object to use. Accepts either "tile", "circle", "text" or "blank".
min_size	when geom has been set to "circle", the minimum size of the circles. Defaults to 2.
max_size	when geom has been set to "circle", the maximum size of the circles. Defaults to 6.
label	whether to add correlation coefficients to the plot. Defaults to FALSE.
label_alpha	whether to make the correlation coefficients increasingly transparent as they come close to 0. Also accepts any numeric value between 0 and 1, in which case the level of transparency is set to that fixed value. Defaults to FALSE (no transparency).
label_color	the color of the correlation coefficients. Defaults to "grey75".
label_round	the decimal rounding of the correlation coefficients. Defaults to 1.
label_size	the size of the correlation coefficients. Defaults to 4.
limits	bounding of color scaling for correlations, set limits = NULL or FALSE to remove
drop	if using nbreaks, whether to drop unused breaks from the color scale. Defaults to FALSE (recommended).
layout.exp	a multiplier to expand the horizontal axis to the left if variable names get clipped. Defaults to 0 (no expansion).
legend.position	where to put the legend of the correlation coefficients: see <a href="#">theme</a> for details. Defaults to "bottom".
legend.size	the size of the legend title and labels, in points: see <a href="#">theme</a> for details. Defaults to 9.
...	other arguments supplied to <a href="#">geom_text</a> for the diagonal labels.

**Note**

Recommended values for the nbreaks argument are 3 to 11, as values above 11 are visually difficult to separate and are not supported by diverging ColorBrewer palettes.

**Author(s)**

Francois Briatte, with contributions from Amos B. Elberg and Barret Schloerke

**See Also**

[cor](#) and [corrplot](#) in the [arm](#) package.

## Examples

```
# Basketball statistics provided by Nathan Yau at Flowing Data.
dt <- read.csv("http://datasets.flowingdata.com/ppg2008.csv")

# Default output.
ggcorr(dt[, -1])

# Labelled output, with coefficient transparency.
ggcorr(dt[, -1],
        label = TRUE,
        label_alpha = TRUE)

# Custom options.
ggcorr(
  dt[, -1],
  name = expression(rho),
  geom = "circle",
  max_size = 10,
  min_size = 2,
  size = 3,
  hjust = 0.75,
  nbreaks = 6,
  angle = -45,
  palette = "PuOr" # colorblind safe, photocopy-able
)

# Supply your own correlation matrix
ggcorr(
  data = NULL,
  cor_matrix = cor(dt[, -1], use = "pairwise")
)
```

---

ggduo

*ggduo - A ggplot2 generalized pairs plot for two columns sets of a data.frame*

---

## Description

Make a matrix of plots with a given data set with two different column sets

## Usage

```
ggduo(
  data,
  mapping = NULL,
  columnsX = 1:ncol(data),
  columnsY = 1:ncol(data),
  title = NULL,
  types = list(continuous = "smooth_loess", comboVertical = "box_no_facet",
```

```

    comboHorizontal = "facethist", discrete = "ratio"),
  axisLabels = c("show", "none"),
  columnLabelsX = colnames(data[columnsX]),
  columnLabelsY = colnames(data[columnsY]),
  labeller = "label_value",
  switch = NULL,
  xlab = NULL,
  ylab = NULL,
  showStrips = NULL,
  legend = NULL,
  cardinality_threshold = 15,
  progress = NULL,
  legends = stop("deprecated")
)

```

## Arguments

<code>data</code>	data set using. Can have both numerical and categorical data.
<code>mapping</code>	aesthetic mapping (besides x and y). See <a href="#">aes()</a> . If mapping is numeric, columns will be set to the mapping value and mapping will be set to NULL.
<code>columnsX, columnsY</code>	which columns are used to make plots. Defaults to all columns.
<code>title, xlab, ylab</code>	title, x label, and y label for the graph
<code>types</code>	see Details
<code>axisLabels</code>	either "show" to display axisLabels or "none" for no axis labels
<code>columnLabelsX, columnLabelsY</code>	label names to be displayed. Defaults to names of columns being used.
<code>labeller</code>	labeller for facets. See <a href="#">labellers</a> . Common values are "label_value" (default) and "label_parsed".
<code>switch</code>	switch parameter for <code>facet_grid</code> . See <code>ggplot2::facet_grid</code> . By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both"
<code>showStrips</code>	boolean to determine if each plot's strips should be displayed. NULL will default to the top and right side plots only. TRUE or FALSE will turn all strips on or off respectively.
<code>legend</code>	May be the two objects described below or the default NULL value. The legend position can be moved by using <code>ggplot2's theme element pm + theme(legend.position = "bottom")</code> <ul style="list-style-type: none"> <li><b>a numeric vector of length 2</b> provides the location of the plot to use the legend for the plot matrix's legend. Such as <code>legend = c(3, 5)</code> which will use the legend from the plot in the third row and fifth column</li> <li><b>a single numeric value</b> provides the location of a plot according to the display order. Such as <code>legend = 3</code> in a plot matrix with 2 rows and 5 columns displayed by column will return the plot in position <code>c(1, 2)</code></li> </ul>

	<b>a object from <code>grab_legend()</code></b> a predetermined plot legend that will be displayed directly
<code>cardinality_threshold</code>	maximum number of levels allowed in a character / factor column. Set this value to NULL to not check factor columns. Defaults to 15
<code>progress</code>	NULL (default) for a progress bar in interactive sessions with more than 15 plots, TRUE for a progress bar, FALSE for no progress bar, or a function that accepts at least a plot matrix and returns a new <code>progress::progress_bar</code> . See <a href="#">ggmatrix_progress</a> .
<code>legends</code>	deprecated

## Details

`types` is a list that may contain the variables 'continuous', 'combo', 'discrete', and 'na'. Each element of the list may be a function or a string. If a string is supplied, it must implement one of the following options:

**continuous** exactly one of ('points', 'smooth', 'smooth\_loess', 'density', 'cor', 'blank'). This option is used for continuous X and Y data.

**comboHorizontal** exactly one of ('box', 'box\_no\_facet', 'dot', 'dot\_no\_facet', 'facethist', 'facetdensity', 'denstrip', 'blank'). This option is used for either continuous X and categorical Y data or categorical X and continuous Y data.

**comboVertical** exactly one of ('box', 'box\_no\_facet', 'dot', 'dot\_no\_facet', 'facethist', 'facetdensity', 'denstrip', 'blank'). This option is used for either continuous X and categorical Y data or categorical X and continuous Y data.

**discrete** exactly one of ('facetbar', 'ratio', 'blank'). This option is used for categorical X and Y data.

**na** exactly one of ('na', 'blank'). This option is used when all X data is NA, all Y data is NA, or either all X or Y data is NA.

If 'blank' is ever chosen as an option, then `ggduo` will produce an empty plot.

If a function is supplied as an option, it should implement the function `api` of `function(data, mapping, ...){#make ggplot2 plot}`. If a specific function needs its parameters set, `wrap(fn, param1 = val1, param2 = val2)` the function with its parameters.

## Examples

```
# small function to display plots only if it's interactive
p_ <- GGally::print_if_interactive

data(baseball, package = "plyr")

# Keep players from 1990-1995 with at least one at bat
# Add how many singles a player hit
# (must do in two steps as X1b is used in calculations)
dt <- transform(
  subset(baseball, year >= 1990 & year <= 1995 & ab > 0),
  X1b = h - X2b - X3b - hr
)
```

```

# Add
# the player's batting average,
# the player's slugging percentage,
# and the player's on base percentage
# Make factor a year, as each season is discrete
dt <- transform(
  dt,
  batting_avg = h / ab,
  slug = (X1b + 2*X2b + 3*X3b + 4*hr) / ab,
  on_base = (h + bb + hbp) / (ab + bb + hbp),
  year = as.factor(year)
)

pm <- ggduo(
  dt,
  c("year", "g", "ab", "lg"),
  c("batting_avg", "slug", "on_base"),
  mapping = ggplot2::aes(color = lg)
)
# Prints, but
# there is severe over plotting in the continuous plots
# the labels could be better
# want to add more hitting information
p_(pm)

# address overplotting issues and add a title
pm <- ggduo(
  dt,
  c("year", "g", "ab", "lg"),
  c("batting_avg", "slug", "on_base"),
  columnLabelsX = c("year", "player game count", "player at bat count", "league"),
  columnLabelsY = c("batting avg", "slug %", "on base %"),
  title = "Baseball Hitting Stats from 1990-1995",
  mapping = ggplot2::aes(color = lg),
  types = list(
    # change the shape and add some transparency to the points
    continuous = wrap("smooth_loess", alpha = 0.50, shape = "+")
  ),
  showStrips = FALSE
);

p_(pm)

# Example derived from:
## R Data Analysis Examples | Canonical Correlation Analysis. UCLA: Institute for Digital
## Research and Education.

```

ggfacet

*ggfacet - single ggplot2 plot matrix with facet\_grid***Description**

ggfacet - single ggplot2 plot matrix with facet\_grid

**Usage**

```
ggfacet(
  data,
  mapping = NULL,
  columnsX = 1:ncol(data),
  columnsY = 1:ncol(data),
  fn = ggally_points,
  ...,
  columnLabelsX = names(data[columnsX]),
  columnLabelsY = names(data[columnsY]),
  xlab = NULL,
  ylab = NULL,
  title = NULL,
  scales = "free"
)
```

**Arguments**

data	data.frame that contains all columns to be displayed. This data will be melted before being passed into the function fn
mapping	aesthetic mapping (besides x and y). See <a href="#">aes()</a>
columnsX	columns to be displayed in the plot matrix
columnsY	rows to be displayed in the plot matrix
fn	function to be executed. Similar to <a href="#">ggpairs</a> and <a href="#">ggduo</a> , the function may either be a string identifier or a real function that <a href="#">wrap</a> understands.
...	extra arguments passed directly to fn
columnLabelsX, columnLabelsY	column and row labels to display in the plot matrix

xlab, ylab, title  
 plot matrix labels  
 scales parameter supplied to `ggplot2::facet_grid`. Default behavior is "free"

### Examples

```
# Small function to display plots only if it's interactive
p_ <- GGally::print_if_interactive
if (requireNamespace("chemometrics", quietly = TRUE)) {
  data(NIR, package = "chemometrics")
  NIR_sub <- data.frame(NIR$yGlcEtOH, NIR$xNIR[,1:3])
  str(NIR_sub)
  x_cols <- c("X1115.0", "X1120.0", "X1125.0")
  y_cols <- c("Glucose", "Ethanol")

  # using ggduo directly
  p <- ggduo(NIR_sub, x_cols, y_cols, types = list(continuous = "points"))
  p_(p)

  # using ggfacet
  p <- ggfacet(NIR_sub, x_cols, y_cols)
  p_(p)

  # add a smoother
  p <- ggfacet(NIR_sub, x_cols, y_cols, fn = 'smooth_loess')
  p_(p)
  # same output
  p <- ggfacet(NIR_sub, x_cols, y_cols, fn = ggally_smooth_loess)
  p_(p)

  # Change scales to be the same in for every row and for every column
  p <- ggfacet(NIR_sub, x_cols, y_cols, scales = "fixed")
  p_(p)
}
```

---

gglegend

*Plot only legend of plot function*

---

### Description

Plot only legend of plot function

### Usage

```
gglegend(fn)
```

### Arguments

fn this value is passed directly to an empty `wrap` call. Please see `?wrap` for more details.

**Value**

a function that when called with arguments will produce the legend of the plotting function supplied.

**Examples**

```
# display regular plot
ggally_points(iris, ggplot2::aes(Sepal.Length, Sepal.Width, color = Species))

# Make a function that will only print the legend
points_legend <- gglegend(ggally_points)
points_legend(iris, ggplot2::aes(Sepal.Length, Sepal.Width, color = Species))

# produce the sample legend plot, but supply a string that 'wrap' understands
same_points_legend <- gglegend("points")
identical(
  attr(attr(points_legend, "fn"), "original_fn"),
  attr(attr(same_points_legend, "fn"), "original_fn")
)

# Complicated examples
custom_legend <- wrap(gglegend("points"), size = 6)
custom_legend(iris, ggplot2::aes(Sepal.Length, Sepal.Width, color = Species))

# Use within ggpairs
pm <- ggpairs(
  iris, 1:2,
  mapping = ggplot2::aes(color = Species),
  upper = list(continuous = gglegend("points"))
)
# pm

# Place a legend in a specific location
pm <- ggpairs(iris, 1:2, mapping = ggplot2::aes(color = Species))
# Make the legend
pm[1,2] <- points_legend(iris, ggplot2::aes(Sepal.Width, Sepal.Length, color = Species))
pm
```

---

ggmatrix

*ggmatrix - A ggplot2 Matrix*

---

**Description**

Make a generic matrix of ggplot2 plots.

**Usage**

```
ggmatrix(
  plots,
  nrow,
```

```

ncol,
xAxisLabels = NULL,
yAxisLabels = NULL,
title = NULL,
xlab = NULL,
ylab = NULL,
byrow = TRUE,
showStrips = NULL,
showAxisPlotLabels = TRUE,
showXAxisPlotLabels = TRUE,
showYAxisPlotLabels = TRUE,
labeller = NULL,
switch = NULL,
xProportions = NULL,
yProportions = NULL,
progress = NULL,
data = NULL,
gg = NULL,
legend = NULL
)

```

### Arguments

<code>plots</code>	list of plots to be put into matrix
<code>nrow, ncol</code>	number of rows and columns
<code>xAxisLabels, yAxisLabels</code>	strip titles for the x and y axis respectively. Set to NULL to not be displayed
<code>title, xlab, ylab</code>	title, x label, and y label for the graph. Set to NULL to not be displayed
<code>byrow</code>	boolean that determines whether the plots should be ordered by row or by column
<code>showStrips</code>	boolean to determine if each plot's strips should be displayed. NULL will default to the top and right side plots only. TRUE or FALSE will turn all strips on or off respectively.
<code>showAxisPlotLabels, showXAxisPlotLabels, showYAxisPlotLabels</code>	booleans that determine if the plots axis labels are printed on the X (bottom) or Y (left) part of the plot matrix. If <code>showAxisPlotLabels</code> is set, both <code>showXAxisPlotLabels</code> and <code>showYAxisPlotLabels</code> will be set to the given value.
<code>labeller</code>	labeller for facets. See <a href="#">labellers</a> . Common values are "label_value" (default) and "label_parsed".
<code>switch</code>	switch parameter for <code>facet_grid</code> . See <code>ggplot2::facet_grid</code> . By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both"
<code>xProportions, yProportions</code>	Value to change how much area is given for each plot. Either NULL (default), numeric value matching respective length, or <code>grid::unit</code> object with matching respective length

progress	NULL (default) for a progress bar in interactive sessions with more than 15 plots, TRUE for a progress bar, FALSE for no progress bar, or a function that accepts at least a plot matrix and returns a new progress: <code>:progress_bar</code> . See <code>ggmatrix_progress</code> .
data	data set using. This is the data to be used in place of <code>'ggally_data'</code> if the plot is a string to be evaluated at print time
gg	ggplot2 theme objects to be applied to every plot
legend	<p>May be the two objects described below or the default NULL value. The legend position can be moved by using ggplot2's theme element <code>pm + theme(legend.position = "bottom")</code></p> <p><b>a numeric vector of length 2</b> provides the location of the plot to use the legend for the plot matrix's legend. Such as <code>legend = c(3, 5)</code> which will use the legend from the plot in the third row and fifth column</p> <p><b>a single numeric value</b> provides the location of a plot according to the display order. Such as <code>legend = 3</code> in a plot matrix with 2 rows and 5 columns displayed by column will return the plot in position <code>c(1, 2)</code></p> <p><b>a object from <code>grab_legend()</code></b> a predetermined plot legend that will be displayed directly</p>

### Memory usage

Now that the `print.ggmatrix` method uses a large `gtable` object, rather than print each plot independently, memory usage may be of concern. From small tests, memory usage flutters around `object.size(data) * 0.3 * length(plots)`. So, for a 80Mb random noise dataset with 100 plots, about 2.4 Gb of memory needed to print. For the 3.46 Mb diamonds dataset with 100 plots, about 100 Mb of memory was needed to print. The benefits of using the ggplot2 format greatly outweigh the price of about 20

### Author(s)

Barret Schloerke <schloerke@gmail.com>

### Examples

```
# small function to display plots only if it's interactive
p_ <- GGally::print_if_interactive

plotList <- list()
for (i in 1:6) {
  plotList[[i]] <- ggally_text(paste("Plot #", i, sep = ""))
}
pm <- ggmatrix(
  plotList,
  2, 3,
  c("A", "B", "C"),
  c("D", "E"),
  byrow = TRUE
)
p_(pm)
```

```
pm <- ggmatrix(  
  plotList,  
  2, 3,  
  xAxisLabels = c("A", "B", "C"),  
  yAxisLabels = NULL,  
  byrow = FALSE,  
  showXAxisPlotLabels = FALSE  
)  
p_(pm)
```

---

ggmatrix_gtable	<i>Print ggmatrix object</i>
-----------------	------------------------------

---

### Description

Specialized method to print the ggmatrix object-

### Usage

```
ggmatrix_gtable(  
  pm,  
  ...,  
  progress = NULL,  
  progress_format = formals(ggmatrix_progress)$format  
)
```

### Arguments

pm	ggmatrix object to be plotted
...	ignored
progress, progress_format	Please use the 'progress' parameter in your ggmatrix-like function. See <a href="#">ggmatrix_progress</a> for a few examples. These parameters will soon be deprecated.

### Author(s)

Barret Schloerke <schloerke@gmail.com>

### Examples

```
data(tips, package = "reshape")  
pm <- ggpairs(tips, c(1,3,2), mapping = ggplot2::aes_string(color = "sex"))  
ggmatrix_gtable(pm)
```

---

ggmatrix_progress	<i>ggmatrix default progress bar</i>
-------------------	--------------------------------------

---

**Description**

ggmatrix default progress bar

**Usage**

```
ggmatrix_progress(
  format = " plot: [:plot_i, :plot_j] [:bar]:percent est::eta ",
  clear = TRUE,
  show_after = 0,
  ...
)
```

**Arguments**

format, clear, show\_after, ...  
 parameters supplied directly to `progress::progress_bar$new()`

**Value**

function that accepts a plot matrix as the first argument and ... for future expansion. Internally, the plot matrix is used to determine the total number of plots for the progress bar.

**Examples**

```
p_ <- GGally::print_if_interactive

pm <- ggpairs(iris, 1:2, progress = ggmatrix_progress())
p_(pm)

# does not clear after finishing
pm <- ggpairs(iris, 1:2, progress = ggmatrix_progress(clear = FALSE))
p_(pm)
```

---

ggnet	<i>ggnet - Plot a network with ggplot2</i>
-------	--

---

**Description**

Function for plotting network objects using `ggplot2`, now replaced by the `ggnet2` function, which provides additional control over plotting parameters. Please visit <http://github.com/briatte/ggnet> for the latest version of `ggnet2`, and <https://briatte.github.io/ggnet> for a vignette that contains many examples and explanations.

**Usage**

```

ggnet(
  net,
  mode = "fruchtermanreingold",
  layout.par = NULL,
  layout.exp = 0,
  size = 9,
  alpha = 1,
  weight = "none",
  weight.legend = NA,
  weight.method = weight,
  weight.min = NA,
  weight.max = NA,
  weight.cut = FALSE,
  group = NULL,
  group.legend = NA,
  node.group = group,
  node.color = NULL,
  node.alpha = alpha,
  segment.alpha = alpha,
  segment.color = "grey50",
  segment.label = NULL,
  segment.size = 0.25,
  arrow.size = 0,
  arrow.gap = 0,
  arrow.type = "closed",
  label = FALSE,
  label.nodes = label,
  label.size = size/2,
  label.trim = FALSE,
  legend.size = 9,
  legend.position = "right",
  names = c("", ""),
  quantize.weights = FALSE,
  subset.threshold = 0,
  top8.nodes = FALSE,
  trim.labels = FALSE,
  ...
)

```

**Arguments**

net	an object of class <a href="#">network</a> , or any object that can be coerced to this class, such as an adjacency or incidence matrix, or an edge list: see <a href="#">edgeset.constructors</a> and <a href="#">network</a> for details. If the object is of class <a href="#">igraph</a> and the <a href="#">intergraph</a> package is installed, it will be used to convert the object: see <a href="#">asNetwork</a> for details.
mode	a placement method from those provided in the <a href="#">sna</a> package: see <a href="#">gplot.layout</a>

	for details. Also accepts the names of two numeric vertex attributes of <code>net</code> , or a matrix of numeric coordinates, in which case the first two columns of the matrix are used. Defaults to the Fruchterman-Reingold force-directed algorithm.
<code>layout.par</code>	options to be passed to the placement method, as listed in <a href="#">gplot.layout</a> . Defaults to NULL.
<code>layout.exp</code>	a multiplier to expand the horizontal axis if node labels get clipped: see <a href="#">expand_range</a> for details. Defaults to 0 (no expansion).
<code>size</code>	size of the network nodes. If the nodes are weighted, their area is proportionally scaled up to the size set by <code>size</code> . Defaults to 9.
<code>alpha</code>	a level of transparency for nodes, vertices and arrows. Defaults to 1.
<code>weight</code>	the weighting method for the nodes, which might be a vertex attribute or a vector of size values. Also accepts "indegree", "outdegree", "degree" or "freeman" to size the nodes by their unweighted degree centrality ("degree" and "freeman" are equivalent): see <a href="#">degree</a> for details. All node weights must be positive. Defaults to "none" (no weighting).
<code>weight.legend</code>	the name to assign to the legend created by <code>weight</code> . Defaults to NA (no name).
<code>weight.method</code>	see <code>weight</code>
<code>weight.min</code>	whether to subset the network to nodes with a minimum size, based on the values of <code>weight</code> . Defaults to NA (preserves all nodes).
<code>weight.max</code>	whether to subset the network to nodes with a maximum size, based on the values of <code>weight</code> . Defaults to NA (preserves all nodes).
<code>weight.cut</code>	whether to cut the size of the nodes into a certain number of quantiles. Accepts TRUE, which tries to cut the sizes into quartiles, or any positive numeric value, which tries to cut the sizes into that many quantiles. If the size of the nodes do not contain the specified number of distinct quantiles, the largest possible number is used. See <a href="#">quantile</a> and <a href="#">cut</a> for details. Defaults to FALSE (does nothing).
<code>group</code>	the groups of the nodes, either as a vector of values or as a vertex attribute. If set to mode on a bipartite network, the nodes will be grouped as "actor" if they belong to the primary mode and "event" if they belong to the secondary mode.
<code>group.legend</code>	the name to assign to the legend created by <code>group</code> .
<code>node.group</code>	see <code>group</code>
<code>node.color</code>	a vector of character strings to color the nodes with, holding as many colors as there are levels in <code>node.group</code> . Defaults to NULL, which will assign grayscale colors to each group.
<code>node.alpha</code>	transparency of the nodes. Inherits from <code>alpha</code> .
<code>segment.alpha</code>	the level of transparency of the edges. Defaults to <code>alpha</code> , which defaults to 1.
<code>segment.color</code>	the color of the edges, as a color value, a vector of color values, or as an edge attribute containing color values. Defaults to "grey50".
<code>segment.label</code>	the labels to plot at the middle of the edges, as a single value, a vector of values, or as an edge attribute. Defaults to NULL (no edge labels).
<code>segment.size</code>	the size of the edges, in points, as a single numeric value, a vector of values, or as an edge attribute. Defaults to 0.25.

<code>arrow.size</code>	the size of the arrows for directed network edges, in points. See <a href="#">arrow</a> for details. Defaults to 0 (no arrows).
<code>arrow.gap</code>	a setting aimed at improving the display of edge arrows by plotting slightly shorter edges. Accepts any value between 0 and 1, where a value of 0.05 will generally achieve good results when the size of the nodes is reasonably small. Defaults to 0 (no shortening).
<code>arrow.type</code>	the type of the arrows for directed network edges. See <a href="#">arrow</a> for details. Defaults to "closed".
<code>label</code>	whether to label the nodes. If set to TRUE, nodes are labeled with their vertex names. If set to a vector that contains as many elements as there are nodes in <code>net</code> , nodes are labeled with these. If set to any other vector of values, the nodes are labeled only when their vertex name matches one of these values. Defaults to FALSE (no labels).
<code>label.nodes</code>	see <code>label</code>
<code>label.size</code>	the size of the node labels, in points, as a numeric value, a vector of numeric values, or as a vertex attribute containing numeric values. Defaults to <code>size / 2</code> (half the maximum node size), which defaults to 6.
<code>label.trim</code>	whether to apply some trimming to the node labels. Accepts any function that can process a character vector, or a strictly positive numeric value, in which case the labels are trimmed to a fixed-length substring of that length: see <a href="#">substr</a> for details. Defaults to FALSE (does nothing).
<code>legend.size</code>	the size of the legend symbols and text, in points. Defaults to 9.
<code>legend.position</code>	the location of the plot legend(s). Accepts all <code>legend.position</code> values supported by <a href="#">theme</a> . Defaults to "right".
<code>names</code>	deprecated: see <code>group.legend</code> and <code>size.legend</code>
<code>quantize.weights</code>	deprecated: see <code>weight.cut</code>
<code>subset.threshold</code>	deprecated: see <code>weight.min</code>
<code>top8.nodes</code>	deprecated: this functionality was experimental and has been removed entirely from <code>ggnet</code>
<code>trim.labels</code>	deprecated: see <code>label.trim</code>
<code>...</code>	other arguments passed to the <code>geom_text</code> object that sets the node labels: see <a href="#">geom_text</a> for details.

## Details

The degree centrality measures that can be produced through the `weight` argument will take the directedness of the network into account, but will be unweighted. To compute weighted network measures, see the `tnet` package by Tore Opsahl (`help("tnet", package = "tnet")`).

# random adjacency matrix
x      <- 10
ndyads <- x * (x - 1)
density <- x / ndyads
m      <- matrix(0, nrow = x, ncol = x)
dimnames(m) <- list(letters[ 1:x ], letters[ 1:x ])
m[ row(m) != col(m) ] <- runif(ndyads) < density
m

# random undirected network
n <- network::network(m, directed = FALSE)
n

ggnet(n, label = TRUE, alpha = 1, color = "white", segment.color = "black")

# random groups
g <- sample(letters[ 1:3 ], 10, replace = TRUE)
g

# color palette
p <- c("a" = "steelblue", "b" = "forestgreen", "c" = "tomato")

ggnet(n, node.group = g, node.color = p, label = TRUE, color = "white")

# edge arrows on a directed network
ggnet(network(m, directed = TRUE), arrow.gap = 0.05, arrow.size = 10)
```

---

ggnet2

*ggnet2 - Plot a network with ggplot2*

---

**Description**

Function for plotting network objects using `ggplot2`, with additional control over graphical parameters that are not supported by the `ggnet` function. Please visit <http://github.com/briatte/ggnet> for the latest version of `ggnet2`, and <https://briatte.github.io/ggnet> for a vignette that contains many examples and explanations.

**Usage**

```
ggnet2(
  net,
  mode = "fruchtermanreingold",
```

```
layout.par = NULL,  
layout.exp = 0,  
alpha = 1,  
color = "grey75",  
shape = 19,  
size = 9,  
max_size = 9,  
na.rm = NA,  
palette = NULL,  
alpha.palette = NULL,  
alpha.legend = NA,  
color.palette = palette,  
color.legend = NA,  
shape.palette = NULL,  
shape.legend = NA,  
size.palette = NULL,  
size.legend = NA,  
size.zero = FALSE,  
size.cut = FALSE,  
size.min = NA,  
size.max = NA,  
label = FALSE,  
label.alpha = 1,  
label.color = "black",  
label.size = max_size/2,  
label.trim = FALSE,  
node.alpha = alpha,  
node.color = color,  
node.label = label,  
node.shape = shape,  
node.size = size,  
edge.alpha = 1,  
edge.color = "grey50",  
edge.lty = "solid",  
edge.size = 0.25,  
edge.label = NULL,  
edge.label.alpha = 1,  
edge.label.color = label.color,  
edge.label.fill = "white",  
edge.label.size = max_size/2,  
arrow.size = 0,  
arrow.gap = 0,  
arrow.type = "closed",  
legend.size = 9,  
legend.position = "right",  
...  
)
```

**Arguments**

net	an object of class <code>network</code> , or any object that can be coerced to this class, such as an adjacency or incidence matrix, or an edge list: see <code>edgeset.constructors</code> and <code>network</code> for details. If the object is of class <code>igraph</code> and the <code>intergraph</code> package is installed, it will be used to convert the object: see <code>asNetwork</code> for details.
mode	a placement method from those provided in the <code>sna</code> package: see <code>gplot.layout</code> for details. Also accepts the names of two numeric vertex attributes of <code>net</code> , or a matrix of numeric coordinates, in which case the first two columns of the matrix are used. Defaults to the Fruchterman-Reingold force-directed algorithm.
layout.par	options to be passed to the placement method, as listed in <code>gplot.layout</code> . Defaults to NULL.
layout.exp	a multiplier to expand the horizontal axis if node labels get clipped: see <code>expand_range</code> for details. Defaults to 0 (no expansion).
alpha	the level of transparency of the edges and nodes, which might be a single value, a vertex attribute, or a vector of values. Also accepts "mode" on bipartite networks (see 'Details'). Defaults to 1 (no transparency).
color	the color of the nodes, which might be a single value, a vertex attribute, or a vector of values. Also accepts "mode" on bipartite networks (see 'Details'). Defaults to <code>grey75</code> .
shape	the shape of the nodes, which might be a single value, a vertex attribute, or a vector of values. Also accepts "mode" on bipartite networks (see 'Details'). Defaults to 19 (solid circle).
size	the size of the nodes, in points, which might be a single value, a vertex attribute, or a vector of values. Also accepts "indegree", "outdegree", "degree" or "freeman" to size the nodes by their unweighted degree centrality ("degree" and "freeman" are equivalent): see <code>degree</code> for details. All node sizes must be strictly positive. Also accepts "mode" on bipartite networks (see 'Details'). Defaults to 9.
max_size	the <i>maximum</i> size of the node when <code>size</code> produces nodes of different sizes, in points. Defaults to 9.
na.rm	whether to subset the network to nodes that are <i>not</i> missing a given vertex attribute. If set to any vertex attribute of <code>net</code> , the nodes for which this attribute is NA will be removed. Defaults to NA (does nothing).
palette	the palette to color the nodes, when <code>color</code> is not a color value or a vector of color values. Accepts named vectors of color values, or if <code>RColorBrewer</code> is installed, any ColorBrewer palette name: see <code>brewer.pal</code> and <a href="http://colorbrewer2.org/">http://colorbrewer2.org/</a> for details. Defaults to NULL, which will create an array of grayscale color values if <code>color</code> is not a color value or a vector of color values.
alpha.palette	the palette to control the transparency levels of the nodes set by <code>alpha</code> when the levels are not numeric values. Defaults to NULL, which will create an array of alpha transparency values if <code>alpha</code> is not a numeric value or a vector of numeric values.
alpha.legend	the name to assign to the legend created by <code>alpha</code> when its levels are not numeric values. Defaults to NA (no name).

<code>color.palette</code>	see <code>palette</code>
<code>color.legend</code>	the name to assign to the legend created by <code>palette</code> . Defaults to NA (no name).
<code>shape.palette</code>	the palette to control the shapes of the nodes set by <code>shape</code> when the shapes are not numeric values. Defaults to NULL, which will create an array of shape values if <code>shape</code> is not a numeric value or a vector of numeric values.
<code>shape.legend</code>	the name to assign to the legend created by <code>shape</code> when its levels are not numeric values. Defaults to NA (no name).
<code>size.palette</code>	the palette to control the sizes of the nodes set by <code>size</code> when the sizes are not numeric values.
<code>size.legend</code>	the name to assign to the legend created by <code>size</code> . Defaults to NA (no name).
<code>size.zero</code>	whether to accept zero-sized nodes based on the value(s) of <code>size</code> . Defaults to FALSE, which ensures that zero-sized nodes are still shown in the plot and its size legend.
<code>size.cut</code>	whether to cut the size of the nodes into a certain number of quantiles. Accepts TRUE, which tries to cut the sizes into quartiles, or any positive numeric value, which tries to cut the sizes into that many quantiles. If the size of the nodes do not contain the specified number of distinct quantiles, the largest possible number is used. See <a href="#">quantile</a> and <a href="#">cut</a> for details. Defaults to FALSE (does nothing).
<code>size.min</code>	whether to subset the network to nodes with a minimum size, based on the values of <code>size</code> . Defaults to NA (preserves all nodes).
<code>size.max</code>	whether to subset the network to nodes with a maximum size, based on the values of <code>size</code> . Defaults to NA (preserves all nodes).
<code>label</code>	whether to label the nodes. If set to TRUE, nodes are labeled with their vertex names. If set to a vector that contains as many elements as there are nodes in <code>net</code> , nodes are labeled with these. If set to any other vector of values, the nodes are labeled only when their vertex name matches one of these values. Defaults to FALSE (no labels).
<code>label.alpha</code>	the level of transparency of the node labels, as a numeric value, a vector of numeric values, or as a vertex attribute containing numeric values. Defaults to 1 (no transparency).
<code>label.color</code>	the color of the node labels, as a color value, a vector of color values, or as a vertex attribute containing color values. Defaults to "black".
<code>label.size</code>	the size of the node labels, in points, as a numeric value, a vector of numeric values, or as a vertex attribute containing numeric values. Defaults to <code>max_size / 2</code> (half the maximum node size), which defaults to 4.5.
<code>label.trim</code>	whether to apply some trimming to the node labels. Accepts any function that can process a character vector, or a strictly positive numeric value, in which case the labels are trimmed to a fixed-length substring of that length: see <a href="#">substr</a> for details. Defaults to FALSE (does nothing).
<code>node.alpha</code>	see <code>alpha</code>
<code>node.color</code>	see <code>color</code>
<code>node.label</code>	see <code>label</code>

<code>node.shape</code>	see <code>shape</code>
<code>node.size</code>	see <code>size</code>
<code>edge.alpha</code>	the level of transparency of the edges. Defaults to the value of <code>alpha</code> , which defaults to 1.
<code>edge.color</code>	the color of the edges, as a color value, a vector of color values, or as an edge attribute containing color values. Defaults to "grey50".
<code>edge.lty</code>	the linetype of the edges, as a linetype value, a vector of linetype values, or as an edge attribute containing linetype values. Defaults to "solid".
<code>edge.size</code>	the size of the edges, in points, as a numeric value, a vector of numeric values, or as an edge attribute containing numeric values. All edge sizes must be strictly positive. Defaults to 0.25.
<code>edge.label</code>	the labels to plot at the middle of the edges, as a single value, a vector of values, or as an edge attribute. Defaults to NULL (no edge labels).
<code>edge.label.alpha</code>	the level of transparency of the edge labels, as a numeric value, a vector of numeric values, or as an edge attribute containing numeric values. Defaults to 1 (no transparency).
<code>edge.label.color</code>	the color of the edge labels, as a color value, a vector of color values, or as an edge attribute containing color values. Defaults to <code>label.color</code> , which defaults to "black".
<code>edge.label.fill</code>	the background color of the edge labels. Defaults to "white".
<code>edge.label.size</code>	the size of the edge labels, in points, as a numeric value, a vector of numeric values, or as an edge attribute containing numeric values. All edge label sizes must be strictly positive. Defaults to <code>max_size / 2</code> (half the maximum node size), which defaults to 4.5.
<code>arrow.size</code>	the size of the arrows for directed network edges, in points. See <a href="#">arrow</a> for details. Defaults to 0 (no arrows).
<code>arrow.gap</code>	a setting aimed at improving the display of edge arrows by plotting slightly shorter edges. Accepts any value between 0 and 1, where a value of 0.05 will generally achieve good results when the size of the nodes is reasonably small. Defaults to 0 (no shortening).
<code>arrow.type</code>	the type of the arrows for directed network edges. See <a href="#">arrow</a> for details. Defaults to "closed".
<code>legend.size</code>	the size of the legend symbols and text, in points. Defaults to 9.
<code>legend.position</code>	the location of the plot legend(s). Accepts all <code>legend.position</code> values supported by <a href="#">theme</a> . Defaults to "right".
...	other arguments passed to the <code>geom_text</code> object that sets the node labels: see <a href="#">geom_text</a> for details.

## Details

The degree centrality measures that can be produced through the `size` argument will take the directedness of the network into account, but will be unweighted. To compute weighted network measures, see the `tnet` package by Tore Opsahl (`help("tnet", package = "tnet")`).

The nodes of bipartite networks can be mapped to their mode by passing the `"mode"` argument to any of `alpha`, `color`, `shape` and `size`, in which case the nodes of the primary mode will be mapped as `"actor"`, and the nodes of the secondary mode will be mapped as `"event"`.

## Examples

```
library(network)

# random adjacency matrix
x <- 10
ndyads <- x * (x - 1)
density <- x / ndyads
m <- matrix(0, nrow = x, ncol = x)
dimnames(m) <- list(letters[ 1:x ], letters[ 1:x ])
m[ row(m) != col(m) ] <- runif(ndyads) < density
m

# random undirected network
n <- network::network(m, directed = FALSE)
n

ggnet2(n, label = TRUE)
ggnet2(n, label = TRUE, shape = 15)
ggnet2(n, label = TRUE, shape = 15, color = "black", label.color = "white")

# add vertex attribute
x = network.vertex.names(n)
x = ifelse(x %in% c("a", "e", "i"), "vowel", "consonant")
n %v% "phono" = x

ggnet2(n, color = "phono")
ggnet2(n, color = "phono", palette = c("vowel" = "gold", "consonant" = "grey"))
ggnet2(n, shape = "phono", color = "phono")

if (require(RColorBrewer)) {

  # random groups
  n %v% "group" <- sample(LETTERS[1:3], 10, replace = TRUE)
```

```

ggnet2(n, color = "group", palette = "Set2")

}

# random weights
n %% "weight" <- sample(1:3, network.edgcount(n), replace = TRUE)
ggnet2(n, edge.size = "weight", edge.label = "weight")

# edge arrows on a directed network
ggnet2(network(m, directed = TRUE), arrow.gap = 0.05, arrow.size = 10)

# Padgett's Florentine wedding data
data(flo, package = "network")
flo

ggnet2(flo, label = TRUE)
ggnet2(flo, label = TRUE, label.trim = 4, vjust = -1, size = 3, color = 1)
ggnet2(flo, label = TRUE, size = 12, color = "white")

```

---

ggnetworkmap

*ggnetworkmap - Plot a network with ggplot2 suitable for overlay on a ggmap:: map ggplot, or other ggplot*

---

## Description

This is a descendant of the original ggnet function. ggnet added the innovation of plotting the network geographically. However, ggnet needed to be the first object in the ggplot chain. ggnetworkmap does not. If passed a ggplot object as its first argument, such as output from ggmap, ggnetworkmap will plot on top of that chart, looking for vertex attributes lon and lat as coordinates. Otherwise, ggnetworkmap will generate coordinates using the Fruchterman-Reingold algorithm.

## Usage

```

ggnetworkmap(
  gg,
  net,
  size = 3,
  alpha = 0.75,
  weight,
  node.group,
  node.color = NULL,
  node.alpha = NULL,
  ring.group,
  segment.alpha = NULL,
  segment.color = "grey",
  great.circles = FALSE,
  segment.size = 0.25,

```

```

    arrow.size = 0,
    label.nodes = FALSE,
    label.size = size/2,
    ...
  )

```

## Arguments

<code>gg</code>	an object of class <code>ggplot</code> .
<code>net</code>	an object of class <code>network</code> , or any object that can be coerced to this class, such as an adjacency or incidence matrix, or an edge list: see <a href="#">edgeset.constructors</a> and <a href="#">network</a> for details. If the object is of class <code>igraph</code> and the <code>intergraph</code> package is installed, it will be used to convert the object: see <a href="#">asNetwork</a> for details.
<code>size</code>	size of the network nodes. Defaults to 3. If the nodes are weighted, their area is proportionally scaled up to the size set by <code>size</code> .
<code>alpha</code>	a level of transparency for nodes, vertices and arrows. Defaults to 0.75.
<code>weight</code>	if present, the unquoted name of a vertex attribute in data. Otherwise nodes are unweighted.
<code>node.group</code>	NULL, the default, or the unquoted name of a vertex attribute that will be used to determine the color of each node.
<code>node.color</code>	If <code>node.group</code> is null, a character string specifying a color.
<code>node.alpha</code>	transparency of the nodes. Inherits from <code>alpha</code> .
<code>ring.group</code>	if not NULL, the default, the unquoted name of a vertex attribute that will be used to determine the color of each node border.
<code>segment.alpha</code>	transparency of the vertex links. Inherits from <code>alpha</code>
<code>segment.color</code>	color of the vertex links. Defaults to "grey".
<code>great.circles</code>	whether to draw edges as great circles using the <code>geosphere</code> package. Defaults to FALSE
<code>segment.size</code>	size of the vertex links, as a vector of values or as a single value. Defaults to 0.25.
<code>arrow.size</code>	size of the vertex arrows for directed network plotting, in centimeters. Defaults to 0.
<code>label.nodes</code>	label nodes with their vertex names attribute. If set to TRUE, all nodes are labelled. Also accepts a vector of character strings to match with vertex names.
<code>label.size</code>	size of the labels. Defaults to <code>size / 2</code> .
<code>...</code>	other arguments supplied to <code>geom_text</code> for the node labels. Arguments pertaining to the title or other items can be achieved through <code>ggplot2</code> methods.

## Details

This is a function for plotting graphs generated by `network` or `igraph` in a more flexible and elegant manner than permitted by `gnnet`. The function does not need to be the first plot in the `ggplot` chain, so the graph can be plotted on top of a map or other chart. Segments can be straight lines, or plotted

as great circles. Note that the great circles feature can produce odd results with arrows and with vertices beyond the plot edges; this is a ggplot2 limitation and cannot yet be fixed. Nodes can have two color schemes, which are then plotted as the center and ring around the node. The color schemes are selected by adding `scale_fill_` or `scale_color_` just like any other ggplot2 plot. If there are no rings, `scale_color` sets the color of the nodes. If there are rings, `scale_color` sets the color of the rings, and `scale_fill` sets the color of the centers. Note that additional arguments in the ... are passed to `geom_text` for plotting labels.

ggnostic

*ggnostic - Plot matrix of statistical model diagnostics*

---

## Description

ggnostic - Plot matrix of statistical model diagnostics

## Usage

```

ggnostic(
  model,
  ...,
  columnsX = attr(data, "var_x"),
  columnsY = c(".resid", ".sigma", ".hat", ".cooksd"),
  columnLabelsX = attr(data, "var_x_label"),
  columnLabelsY = gsub("\\.", " ", gsub("^\\.", "", columnsY)),
  xlab = "explanatory variables",
  ylab = "diagnostics",
  title = paste(deparse(model$call, width.cutoff = 500L), collapse = "\n"),
  continuous = list(default = ggally_points, .fitted = ggally_points, .se.fit =
    ggally_nostic_se_fit, .resid = ggally_nostic_resid, .hat = ggally_nostic_hat, .sigma
    = ggally_nostic_sigma, .cooksd = ggally_nostic_cooksd, .std.resid =
    ggally_nostic_std_resid),
  combo = list(default = ggally_box_no_facet, fitted = ggally_box_no_facet, .se.fit =
    ggally_nostic_se_fit, .resid = ggally_nostic_resid, .hat = ggally_nostic_hat, .sigma
    = ggally_nostic_sigma, .cooksd = ggally_nostic_cooksd, .std.resid =
    ggally_nostic_std_resid),
  discrete = list(default = ggally_ratio, .fitted = ggally_ratio, .se.fit =
    ggally_ratio, .resid = ggally_ratio, .hat = ggally_ratio, .sigma = ggally_ratio,
    .cooksd = ggally_ratio, .std.resid = ggally_ratio),
  progress = NULL,
  data = broomify(model)
)

```

**Arguments**

<code>model</code>	statistical model object such as output from <code>stats::lm</code> or <code>stats::glm</code>
<code>...</code>	arguments passed directly to <code>ggduo</code>
<code>columnsX</code>	columns to be displayed in the plot matrix. Defaults to the predictor columns of the model
<code>columnsY</code>	rows to be displayed in the plot matrix. Defaults to residuals, leave one out sigma value, diagonal of the hat matrix, and Cook's Distance. The possible values are the response variables in the model and the added columns provided by <code>broom::augment(model)</code> . See details for more information.
<code>columnLabelsX</code> , <code>columnLabelsY</code>	column and row labels to display in the plot matrix
<code>xlab</code> , <code>ylab</code> , <code>title</code>	plot matrix labels passed directly to <code>ggmatrix</code>
<code>continuous</code> , <code>combo</code> , <code>discrete</code>	list of functions for each y variable. See details for more information.
<code>progress</code>	NULL (default) for a progress bar in interactive sessions with more than 15 plots, TRUE for a progress bar, FALSE for no progress bar, or a function that accepts at least a plot matrix and returns a new <code>progress::progress_bar</code> . See <code>ggmatrix_progress</code> .
<code>data</code>	data defaults to a 'broomify'ed model object. This object will contain information about the X variables, Y variables, and multiple broom outputs. See <code>broomify(model)</code> for more information

**'columnsY'**

`broom::augment()` collects data from the supplied model and returns a data.frame with the following columns (taken directly from broom documentation). These columns are the only allowed values in the `columnsY` parameter to `ggnostic`.

**.resid** Residuals

**.hat** Diagonal of the hat matrix

**.sigma** Estimate of residual standard deviation when corresponding observation is dropped from model

**.cooks** Cooks distance, `cooks.distance`

**.fitted** Fitted values of model

**.se.fit** Standard errors of fitted values

**.std.resid** Standardized residuals

**response variable name** The response variable in the model may be added. Such as "mpg" in the model `lm(mpg ~ ., data = mtcars)`

**'continuous', 'combo', 'discrete' types**

Similar to `ggduo` and `ggpairs`, functions may be supplied to display the different column types. However, since the Y rows are fixed, each row has its own corresponding function in each of the plot types: continuous, combo, and discrete. Each plot type list can have keys that correspond

to the broom::`augment()` output: `".fitted"`, `".resid"`, `".std.resid"`, `".sigma"`, `".se.fit"`, `".hat"`, `".cooks"`. An extra key, `"default"`, is used to plot the response variables of the model if they are included. Having a function for each diagnostic allows for very fine control over the diagnostics plot matrix. The functions for each type list are wrapped into a switch function that calls the function corresponding to the y variable being plotted. These switch functions are then passed directly to the `types` parameter in `ggduo`.

## Examples

```
# small function to display plots only if it's interactive
p_ <- GGally::print_if_interactive
data(mtcars)

# use mtcars dataset and alter the 'am' column to display actual name values
mtc <- mtcars
mtc$am <- c("0" = "automatic", "1" = "manual")[as.character(mtc$am)]

# step the complete model down to a smaller model
mod <- stats::step(stats::lm(mpg ~ ., data = mtc), trace = FALSE)

# display using defaults
pm <- ggnostic(mod)
p_(pm)

# color by am value
pm <- ggnostic(mod, mapping = ggplot2::aes(color = am))
p_(pm)

# turn resid smooth error ribbon off
pm <- ggnostic(mod, continuous = list(.resid = wrap("nostic_resid", se = FALSE)))
p_(pm)

## plot residuals vs fitted in a ggpairs plot matrix
dt <- broomify(mod)
pm <- ggpairs(
  dt, c(".fitted", ".resid"),
  columnLabels = c("fitted", "residuals"),
  lower = list(continuous = ggally_nostic_resid)
)
p_(pm)
```

## Description

Make a matrix of plots with a given data set

**Usage**

```

ggpairs(
  data,
  mapping = NULL,
  columns = 1:ncol(data),
  title = NULL,
  upper = list(continuous = "cor", combo = "box_no_facet", discrete = "facetbar", na =
    "na"),
  lower = list(continuous = "points", combo = "facethist", discrete = "facetbar", na =
    "na"),
  diag = list(continuous = "densityDiag", discrete = "barDiag", na = "naDiag"),
  params = NULL,
  ...,
  xlab = NULL,
  ylab = NULL,
  axisLabels = c("show", "internal", "none"),
  columnLabels = colnames(data[columns]),
  labeller = "label_value",
  switch = NULL,
  showStrips = NULL,
  legend = NULL,
  cardinality_threshold = 15,
  progress = NULL,
  legends = stop("deprecated")
)

```

**Arguments**

<code>data</code>	data set using. Can have both numerical and categorical data.
<code>mapping</code>	aesthetic mapping (besides x and y). See <a href="#">aes()</a> . If mapping is numeric, columns will be set to the mapping value and mapping will be set to NULL.
<code>columns</code>	which columns are used to make plots. Defaults to all columns.
<code>title, xlab, ylab</code>	title, x label, and y label for the graph
<code>upper</code>	see Details
<code>lower</code>	see Details
<code>diag</code>	see Details
<code>params</code>	deprecated. Please see <a href="#">wrap_fn_with_param_arg</a>
<code>...</code>	deprecated. Please use mapping
<code>axisLabels</code>	either "show" to display axisLabels, "internal" for labels in the diagonal plots, or "none" for no axis labels
<code>columnLabels</code>	label names to be displayed. Defaults to names of columns being used.
<code>labeller</code>	labeller for facets. See <a href="#">labellers</a> . Common values are "label_value" (default) and "label_parsed".

switch	switch parameter for <code>facet_grid</code> . See <code>ggplot2::facet_grid</code> . By default, the labels are displayed on the top and right of the plot. If "x", the top labels will be displayed to the bottom. If "y", the right-hand side labels will be displayed to the left. Can also be set to "both"
showStrips	boolean to determine if each plot's strips should be displayed. NULL will default to the top and right side plots only. TRUE or FALSE will turn all strips on or off respectively.
legend	<p>May be the two objects described below or the default NULL value. The legend position can be moved by using <code>ggplot2</code>'s theme element <code>pm + theme(legend.position = "bottom")</code></p> <p><b>a numeric vector of length 2</b> provides the location of the plot to use the legend for the plot matrix's legend. Such as <code>legend = c(3, 5)</code> which will use the legend from the plot in the third row and fifth column</p> <p><b>a single numeric value</b> provides the location of a plot according to the display order. Such as <code>legend = 3</code> in a plot matrix with 2 rows and 5 columns displayed by column will return the plot in position <code>c(1, 2)</code></p> <p><b>a object from <code>grab_legend()</code></b> a predetermined plot legend that will be displayed directly</p>
cardinality_threshold	maximum number of levels allowed in a character / factor column. Set this value to NULL to not check factor columns. Defaults to 15
progress	NULL (default) for a progress bar in interactive sessions with more than 15 plots, TRUE for a progress bar, FALSE for no progress bar, or a function that accepts at least a plot matrix and returns a new <code>progress::progress_bar</code> . See <code>ggmatrix_progress</code> .
legends	deprecated

## Details

`upper` and `lower` are lists that may contain the variables 'continuous', 'combo', 'discrete', and 'na'. Each element of the list may be a function or a string. If a string is supplied, it must implement one of the following options:

**continuous** exactly one of ('points', 'smooth', 'smooth\_loess', 'density', 'cor', 'blank'). This option is used for continuous X and Y data.

**combo** exactly one of ('box', 'box\_no\_facet', 'dot', 'dot\_no\_facet', 'facethist', 'facetdensity', 'denstrip', 'blank'). This option is used for either continuous X and categorical Y data or categorical X and continuous Y data.

**discrete** exactly one of ('facetbar', 'ratio', 'blank'). This option is used for categorical X and Y data.

**na** exactly one of ('na', 'blank'). This option is used when all X data is NA, all Y data is NA, or either all X or Y data is NA.

`diag` is a list that may only contain the variables 'continuous', 'discrete', and 'na'. Each element of the `diag` list is a string implementing the following options:

**continuous** exactly one of ('densityDiag', 'barDiag', 'blankDiag'). This option is used for continuous X data.

**discrete** exactly one of ('barDiag', 'blankDiag'). This option is used for categorical X and Y data.

**na** exactly one of ('naDiag', 'blankDiag'). This option is used when all X data is NA.

If 'blank' is ever chosen as an option, then ggpairs will produce an empty plot.

If a function is supplied as an option to upper, lower, or diag, it should implement the function api of `function(data, mapping, ...){#make ggplot2 plot}`. If a specific function needs its parameters set, `wrap(fn, param1 = val1, param2 = val2)` the function with its parameters.

## Value

ggmatrix object that if called, will print

```

---

ggparcoord

*ggparcoord - A ggplot2 Parallel Coordinate Plot*

---

## Description

A function for plotting static parallel coordinate plots, utilizing the ggplot2 graphics package.

## Usage

```

ggparcoord(
  data,
  columns = 1:ncol(data),
  groupColumn = NULL,
  scale = "std",
  scaleSummary = "mean",
  centerObsID = 1,
  missing = "exclude",

```

```

order = columns,
showPoints = FALSE,
splineFactor = FALSE,
alphaLines = 1,
boxplot = FALSE,
shadeBox = NULL,
mapping = NULL,
title = ""
)

```

### Arguments

<code>data</code>	the dataset to plot
<code>columns</code>	a vector of variables (either names or indices) to be axes in the plot
<code>groupColumn</code>	a single variable to group (color) by
<code>scale</code>	method used to scale the variables (see Details)
<code>scaleSummary</code>	if <code>scale=="center"</code> , summary statistic to univariately center each variable by
<code>centerObsID</code>	if <code>scale=="centerObs"</code> , row number of case plot should univariately be centered on
<code>missing</code>	method used to handle missing values (see Details)
<code>order</code>	method used to order the axes (see Details)
<code>showPoints</code>	logical operator indicating whether points should be plotted or not
<code>splineFactor</code>	logical or numeric operator indicating whether spline interpolation should be used. Numeric values will multiplied by the number of columns, TRUE will default to cubic interpolation, <code>AsIs</code> to set the knot count directly and 0, FALSE, or non-numeric values will not use spline interpolation.
<code>alphaLines</code>	value of alpha scaler for the lines of the parcoord plot or a column name of the data
<code>boxplot</code>	logical operator indicating whether or not boxplots should underlay the distribution of each variable
<code>shadeBox</code>	color of underlying box which extends from the min to the max for each variable (no box is plotted if <code>shadeBox == NULL</code> )
<code>mapping</code>	aes string to pass to ggplot object
<code>title</code>	character string denoting the title of the plot

### Details

`scale` is a character string that denotes how to scale the variables in the parallel coordinate plot. Options:

- `std`: univariately, subtract mean and divide by standard deviation
- `robust`: univariately, subtract median and divide by median absolute deviation
- `uniminmax`: univariately, scale so the minimum of the variable is zero, and the maximum is one

- `globalminmax`: no scaling is done; the range of the graphs is defined by the global minimum and the global maximum
- `center`: use `uniminmax` to standardize vertical height, then center each variable at a value specified by the `scaleSummary` param
- `centerObs`: use `uniminmax` to standardize vertical height, then center each variable at the value of the observation specified by the `centerObsID` param

`missing` is a character string that denotes how to handle missing values. Options:

- `exclude`: remove all cases with missing values
- `mean`: set missing values to the mean of the variable
- `median`: set missing values to the median of the variable
- `min10`: set missing values to 10% below the minimum of the variable
- `random`: set missing values to value of randomly chosen observation on that variable

`order` is either a vector of indices or a character string that denotes how to order the axes (variables) of the parallel coordinate plot. Options:

- `(default)`: order by the vector denoted by `columns`
- `(given vector)`: order by the vector specified
- `anyClass`: order variables by their separation between any one class and the rest (as opposed to their overall variation between classes). This is accomplished by calculating the F-statistic for each class vs. the rest, for each axis variable. The axis variables are then ordered (decreasing) by their maximum of k F-statistics, where k is the number of classes.
- `allClass`: order variables by their overall F statistic (decreasing) from an ANOVA with `groupColumn` as the explanatory variable (note: it is required to specify a `groupColumn` with this ordering method). Basically, this method orders the variables by their variation between classes (most to least).
- `skewness`: order variables by their sample skewness (most skewed to least skewed)
- `Outlying`: order by the scagnostic measure, `Outlying`, as calculated by the package `scagnostics`. Other scagnostic measures available to order by are `Skewed`, `Clumpy`, `Sparse`, `Striated`, `Convex`, `Skinny`, `Stringy`, and `Monotonic`. Note: To use these methods of ordering, you must have the `scagnostics` package loaded.

## Value

ggplot object that if called, will print

splineFactor <- length(columns) * 3
p <- ggparcoord(diamonds.samp, columns, groupColumn = 2, splineFactor = I(splineFactor))
p_(p)

```

---

ggscatmat

*ggscatmat - a traditional scatterplot matrix for purely quantitative variables*

---

## Description

This function makes a scatterplot matrix for quantitative variables with density plots on the diagonal and correlation printed in the upper triangle.

## Usage

```

ggscatmat(
  data,
  columns = 1:ncol(data),
  color = NULL,
  alpha = 1,
  corMethod = "pearson"
)

```

## Arguments

<code>data</code>	a data matrix. Should contain numerical (continuous) data.
<code>columns</code>	an option to choose the column to be used in the raw dataset. Defaults to <code>1:ncol(data)</code> .
<code>color</code>	an option to group the dataset by the factor variable and color them by different colors. Defaults to <code>NULL</code> , i.e. no coloring. If supplied, it will be converted to a factor.
<code>alpha</code>	an option to set the transparency in scatterplots for large data. Defaults to 1.
<code>corMethod</code>	method argument supplied to <code>cor</code>

**Author(s)**

Mengjia Ni, Di Cook <dicook@monash.edu>

**Examples**

```
data(flea)
ggscatmat(flea, columns = 2:4)
ggscatmat(flea, columns = 2:4, color = "species")
```

---

ggsurv

*Survival curves with ggplot2*

---

**Description**

This function produces Kaplan-Meier plots using ggplot2. As a first argument it needs a `survfit` object, created by the `survival` package. Default settings differ for single stratum and multiple strata objects.

**Usage**

```
ggsurv(  
  s,  
  CI = "def",  
  plot.cens = TRUE,  
  surv.col = "gg.def",  
  cens.col = "gg.def",  
  lty.est = 1,  
  lty.ci = 2,  
  size.est = 0.5,  
  size.ci = size.est,  
  cens.size = 2,  
  cens.shape = 3,  
  back.white = FALSE,  
  xlab = "Time",  
  ylab = "Survival",  
  main = "",  
  order.legend = TRUE  
)
```

**Arguments**

<code>s</code>	an object of class <code>survfit</code>
<code>CI</code>	should a confidence interval be plotted? Defaults to <code>TRUE</code> for single stratum objects and <code>FALSE</code> for multiple strata objects.
<code>plot.cens</code>	mark the censored observations?

<code>surv.col</code>	colour of the survival estimate. Defaults to black for one stratum, and to the default <code>ggplot2</code> colours for multiple strata. Length of vector with colour names should be either 1 or equal to the number of strata.
<code>cens.col</code>	colour of the points that mark censored observations.
<code>lty.est</code>	linetype of the survival curve(s). Vector length should be either 1 or equal to the number of strata.
<code>lty.ci</code>	linetype of the bounds that mark the 95% CI.
<code>size.est</code>	line width of the survival curve
<code>size.ci</code>	line width of the 95% CI
<code>cens.size</code>	point size of the censoring points
<code>cens.shape</code>	shape of the points that mark censored observations.
<code>back.white</code>	if TRUE the background will not be the default grey of <code>ggplot2</code> but will be white with borders around the plot.
<code>xlab</code>	the label of the x-axis.
<code>ylab</code>	the label of the y-axis.
<code>main</code>	the plot label.
<code>order.legend</code>	boolean to determine if the legend display should be ordered by final survival time

**Value**

An object of class `ggplot`

**Author(s)**

Edwin Thoen <edwinthoen@gmail.com>

**Examples**

```
if (require(survival) && require(scales)) {
  data(lung, package = "survival")
  sf.lung <- survival::survfit(Surv(time, status) ~ 1, data = lung)
  ggsurv(sf.lung)

  # Multiple strata examples
  sf.sex <- survival::survfit(Surv(time, status) ~ sex, data = lung)
  pl.sex <- ggsurv(sf.sex)
  pl.sex

  # Adjusting the legend of the ggsurv fit
  pl.sex +
    ggplot2::guides(linetype = FALSE) +
    ggplot2::scale_colour_discrete(
      name = 'Sex',
      breaks = c(1,2),
      labels = c('Male', 'Female')
```

```

)

# Multiple factors
lung2 <- plyr::mutate(lung, older = as.factor(age > 60))
sf.sex2 <- survival::survfit(Surv(time, status) ~ sex + older, data = lung2)
pl.sex2 <- ggtsurv(sf.sex2)
pl.sex2

# Change legend title
pl.sex2 + labs(color = "New Title", linetype = "New Title")

# We can still adjust the plot after fitting
data(kidney, package = "survival")
sf.kid <- survival::survfit(Surv(time, status) ~ disease, data = kidney)
pl.kid <- ggtsurv(sf.kid, plot.cens = FALSE)
pl.kid

# Zoom in to first 80 days
pl.kid + ggplot2::coord_cartesian(xlim = c(0, 80), ylim = c(0.45, 1))

# Add the diseases names to the plot and remove legend
pl.kid +
  ggplot2::annotate(
    "text",
    label = c("PKD", "Other", "GN", "AN"),
    x      = c(90, 125, 5, 60),
    y      = c(0.8, 0.65, 0.55, 0.30),
    size   = 5,
    colour = scales::hue_pal(
      h      = c(0, 360) + 15,
      c      = 100,
      l      = 65,
      h.start = 0,
      direction = 1
    )(4)
  ) +
  ggplot2::guides(color = FALSE, linetype = FALSE)
}

```

**Description**

GGally implementation of `ts.plot`. Wraps around the `ggduo` function and removes the column strips

**Usage**

```
ggts(..., columnLabelsX = NULL, xlab = "time")
```

**Arguments**

... supplied directly to `ggduo`  
 columnLabelsX remove top strips for the X axis by default  
 xlab defaults to "time"

**Value**

ggmatrix object

**Examples**

```
ggts(pigs, "time", c("gilts", "profit", "s_per_herdsz", "production", "herdsz"))
```

---

glyphplot	<i>Glyph plot class</i>
-----------	-------------------------

---

**Description**

Glyph plot class

**Usage**

```
glyphplot(data, width, height, polar, x_major, y_major)
```

```
is.glyphplot(x)
```

```
## S3 method for class 'glyphplot'  
x[...]
```

```
## S3 method for class 'glyphplot'  
print(x, ...)
```

**Arguments**

data A data frame containing variables named in `x_major`, `x_minor`, `y_major` and `y_minor`.

height, width The height and width of each glyph. Defaults to 95% of the `resolution` of the data. Specify the width absolutely by supplying a numeric vector of length 1, or relative to the

polar A logical of length 1, specifying whether the glyphs should be drawn in polar coordinates. Defaults to FALSE.

x\_major, y\_major The name of the variable (as a string) for the major x and y axes. Together, the

x glyphplot to be printed

... ignored

**Author(s)**

Di Cook <dicook@monash.edu>, Heike Hofmann, Hadley Wickham

---

glyphs

*Create the data needed to generate a glyph plot.*

---

**Description**

Create the data needed to generate a glyph plot.

**Usage**

```
glyphs(  
  data,  
  x_major,  
  x_minor,  
  y_major,  
  y_minor,  
  polar = FALSE,  
  height = ggplot2::rel(0.95),  
  width = ggplot2::rel(0.95),  
  y_scale = identity,  
  x_scale = identity  
)
```

**Arguments**

<code>data</code>	A data frame containing variables named in <code>x_major</code> , <code>x_minor</code> , <code>y_major</code> and <code>y_minor</code> .
<code>x_major</code> , <code>x_minor</code> , <code>y_major</code> , <code>y_minor</code>	The name of the variable (as a string) for the major and minor x and y axes. Together, each unique
<code>polar</code>	A logical of length 1, specifying whether the glyphs should be drawn in polar coordinates. Defaults to FALSE.
<code>height</code> , <code>width</code>	The height and width of each glyph. Defaults to 95% of the <a href="#">resolution</a> of the data. Specify the width absolutely by supplying a numeric vector of length 1, or relative to the
<code>y_scale</code> , <code>x_scale</code>	The scaling function to be applied to each set of minor values within a grid cell. Defaults to <a href="#">identity</a> so that no scaling is performed.

**Author(s)**

Di Cook <dicook@monash.edu>, Heike Hofmann, Hadley Wickham

**Examples**

```

data(nasa)
nasaLate <- nasa[
  nasa$date >= as.POSIXct("1998-01-01") &
  nasa$lat >= 20 &
  nasa$lat <= 40 &
  nasa$long >= -80 &
  nasa$long <= -60
, ]
temp.gly <- glyphs(nasaLate, "long", "day", "lat", "surftemp", height=2.5)
ggplot2::ggplot(temp.gly, ggplot2::aes(gx, gy, group = gid)) +
  add_ref_lines(temp.gly, color = "grey90") +
  add_ref_boxes(temp.gly, color = "grey90") +
  ggplot2::geom_path() +
  ggplot2::theme_bw() +
  ggplot2::labs(x = "", y = "")

```

---

grab\_legend

*Grab the legend and print it as a plot*

---

**Description**

Grab the legend and print it as a plot

**Usage**

```
grab_legend(p)
```

```
## S3 method for class 'legend_guide_box'
print(x, ..., plotNew = FALSE)
```

**Arguments**

p	ggplot2 plot object
x	legend object that has been grabbed from a ggplot2 object
...	ignored
plotNew	boolean to determine if the 'grid.newpage()' command and a new blank rectangle should be printed

**Examples**

```

library(ggplot2)
histPlot <- qplot(
  x = Sepal.Length,
  data = iris,
  fill = Species,
  geom = "histogram",
  binwidth = 1/4
)

```

```
)  
(right <- histPlot)  
(bottom <- histPlot + theme(legend.position = "bottom"))  
(top <- histPlot + theme(legend.position = "top"))  
(left <- histPlot + theme(legend.position = "left"))  
  
grab_legend(right)  
grab_legend(bottom)  
grab_legend(top)  
grab_legend(left)
```

---

happy

*Data related to happiness from the General Social Survey, 1972-2006.*

---

## Description

This data extract is taken from Hadley Wickham's `productplots` package. The original description follows, with minor edits.

## Usage

```
data(happy)
```

## Format

A data frame with 51020 rows and 10 variables

## Details

The data is a small sample of variables related to happiness from the General Social Survey (GSS). The GSS is a yearly cross-sectional survey of Americans, run from 1972. We combine data for 25 years to yield 51,020 observations, and of the over 5,000 variables, we select nine related to happiness:

- `age`. age in years: 18–89.
- `degree`. highest education: lt high school, high school, junior college, bachelor, graduate.
- `finrela`. relative financial status: far above, above average, average, below average, far below.
- `happy`. happiness: very happy, pretty happy, not too happy.
- `health`. health: excellent, good, fair, poor.
- `marital`. marital status: married, never married, divorced, widowed, separated.
- `sex`. sex: female, male.
- `wtsall`. probability weight. 0.43–6.43.

---

is_horizontal	<i>Check if plot is horizontal</i>
---------------	------------------------------------

---

## Description

Check if plot is horizontal

## Usage

```
is_horizontal(data, mapping, val = "y")  
is_character_column(data, mapping, val = "y")
```

## Arguments

data	data used in ggplot2 plot
mapping	ggplot2 aes() mapping
val	key to retrieve from mapping

## Value

Boolean determining if the data is a character-like data

## Examples

```
is_horizontal(iris, ggplot2::aes(Sepal.Length, Species)) # TRUE  
is_horizontal(iris, ggplot2::aes(Sepal.Length, Species), "x") # FALSE  
is_horizontal(iris, ggplot2::aes(Sepal.Length, Sepal.Width)) # FALSE
```

---

lowertriangle	<i>lowertriangle - rearrange dataset as the preparation of ggscatmat function</i>
---------------	---

---

**Description**

function for making the melted dataset used to plot the lowertriangle scatterplots.

**Usage**

```
lowertriangle(data, columns = 1:ncol(data), color = NULL)
```

**Arguments**

data	a data matrix. Should contain numerical (continuous) data.
columns	an option to choose the column to be used in the raw dataset. Defaults to 1:ncol(data)
color	an option to choose a factor variable to be grouped with. Defaults to (NULL)

**Author(s)**

Mengjia Ni, Di Cook <dicook@monash.edu>

**Examples**

```
data(flea)
head(lowertriangle(flea, columns= 2:4))
head(lowertriangle(flea))
head(lowertriangle(flea, color="species"))
```

---

mapping_string	<i>Aes name</i>
----------------	-----------------

---

**Description**

Aes name

**Usage**

```
mapping_string(aes_col)
```

**Arguments**

aes_col	Single value from ggplot2:: <a href="#">aes(...)</a>
---------	--

**Value**

character string

**Examples**

```
mapping <- ggplot2::aes(Petal.Length)
mapping_string(mapping$x)
```

---

mapping_swap_x_y	<i>Swap x and y mapping</i>
------------------	-----------------------------

---

**Description**

Swap x and y mapping

**Usage**

```
mapping_swap_x_y(mapping)
```

**Arguments**

mapping            output of `ggplot2::aes(...)`

**Value**

Aes mapping with the x and y values switched

**Examples**

```
mapping <- ggplot2::aes(Petal.Length, Sepal.Width)
mapping
mapping_swap_x_y(mapping)
```

---

model_response_variables	<i>Model term names</i>
--------------------------	-------------------------

---

**Description**

Retrieve either the response variable names, the beta variable names, or beta variable names. If the model is an object of class 'lm', by default, the beta variable names will include anova significance stars.

**Usage**

```

model_response_variables(model, data = broom::augment(model))

model_beta_variables(model, data = broom::augment(model))

model_beta_label(model, data = broom::augment(model), lmStars = TRUE)

```

**Arguments**

model	model in question
data	equivalent to broom::augment(model)
lmStars	boolean that determines if stars are added to labels

**Value**

character vector of names

---

nasa	<i>Data from the Data Expo JSM 2006.</i>
------	--

---

**Description**

This data was provided by NASA for the competition.

**Usage**

```
data(nasa)
```

**Format**

A data frame with 41472 rows and 17 variables

**Details**

The data shows 6 years of monthly measurements of a 24x24 spatial grid from Central America:

- time integer specifying temporal order of measurements
- x, y, lat, long spatial location of measurements.
- cloudhigh, cloudlow, cloudmid, ozone, pressure, surftemp, temperature are the various satellite measurements.
- date, day, month, year specifying the time of measurements.
- id unique ide for each spatial position.

---

pigs

*United Kingdom Pig Production*

---

### **Description**

This data contains about the United Kingdom Pig Production from the book 'Data' by Andrews and Herzberg. The original data can be on Statlib: <http://lib.stat.cmu.edu/datasets/Andrews/T62.1>

### **Usage**

```
data(pigs)
```

### **Format**

A data frame with 48 rows and 8 variables

### **Details**

The time variable has been added from a combination of year and quarter

- time year + (quarter - 1) / 4
- year year of production
- quarter quarter of the year of production
- gilts number of sows giving birth for the first time
- profit ratio of price to an index of feed price
- s\_per\_herdsz ratio of the number of breeding pigs slaughtered to the total breeding herd size
- production number of pigs slaughtered that were reared for meat
- herdsz breeding herd size

### **References**

Andrews, David F., and Agnes M. Herzberg. Data: a collection of problems from many fields for the student and research worker. Springer Science & Business Media, 2012.

---

print.ggmatrix      *Print ggmatrix object*

---

### Description

Print method taken from `ggplot2:::print.ggplot` and altered for a `ggmatrix` object

### Usage

```
## S3 method for class 'ggmatrix'  
print(x, newpage = is.null(vp), vp = NULL, ...)
```

### Arguments

x	plot to display
newpage	draw new (empty) page first?
vp	viewport to draw plot in
...	arguments passed onto <a href="#">ggmatrix_gtable</a>

### Author(s)

Barret Schloerke

### Examples

```
data(tips, package = "reshape")  
pMat <- ggpairs(tips, c(1,3,2), mapping = ggplot2::aes_string(color = "sex"))  
pMat # calls print(pMat), which calls print.ggmatrix(pMat)
```

---

print\_if\_interactive      *Print if not CRAN*

---

### Description

Small function to print a plot if the R session is interactive or in a travis build

### Usage

```
print_if_interactive(p)
```

### Arguments

p	plot to be displayed
---	----------------------

---

psychademic

*UCLA canonical correlation analysis data*

---

### Description

This data contains 600 observations on eight variables

### Usage

```
data(psychademic)
```

### Format

A data frame with 600 rows and 8 variables

### Details

- locus\_of\_control - psychological
- self\_concept - psychological
- motivation - psychological. Converted to four character groups
- read - academic
- write - academic
- math - academic
- science - academic
- female - academic. Dropped from original source
- sex - academic. Added as a character version of female column

### References

---

putPlot	<i>Put Plot</i>
---------	-----------------

---

### Description

Function to place your own plot in the layout.

### Usage

```
putPlot(pm, value, i, j)

## S3 replacement method for class 'ggmatrix'
pm[i, j, ...] <- value
```

### Arguments

pm	ggally object to be altered
value	ggplot object to be placed
i	row from the top
j	column from the left
...	ignored

### Author(s)

Barret Schloerke <schloerke@gmail.com>

### Examples

```
custom_car <- ggpairs(mtcars[, c("mpg", "wt", "cyl")], upper = "blank", title = "Custom Example")
# ggplot example taken from example(geom_text)
plot <- ggplot2::ggplot(mtcars, ggplot2::aes(x=wt, y=mpg, label=rownames(mtcars)))
plot <- plot +
  ggplot2::geom_text(ggplot2::aes(colour=factor(cyl)), size = 3) +
  ggplot2::scale_colour_discrete(l=40)
custom_car[1, 2] <- plot
personal_plot <- ggally_text(
  "ggpairs allows you\nto put in your\nown plot.\nLike that one.\n <---"
)
custom_car[1, 3] <- personal_plot
# custom_car

# remove plots after creating a plot matrix
custom_car[2,1] <- NULL
custom_car[3,1] <- "blank" # the same as storing null
custom_car[3,2] <- NULL
custom_car
```

---

rescale01	<i>Rescaling functions</i>
-----------	----------------------------

---

**Description**

Rescaling functions

**Usage**

range01(x)

max1(x)

mean0(x)

min0(x)

rescale01(x, xlim = NULL)

rescale11(x, xlim = NULL)

**Arguments**

x	numeric vector
xlim	value used in range

---

scag_order	<i>Find order of variables</i>
------------	--------------------------------

---

**Description**

Find order of variables based on a specified scagnostic measure by maximizing the index values of that measure along the path.

**Usage**

scag\_order(scag, vars, measure)

**Arguments**

scag	scagnostics object
vars	character vector of the variables to be ordered
measure	scagnostics measure to order according to

**Value**

character vector of variable ordered according to the given scagnostic measure

**Author(s)**

Barret Schloerke

---

scatmat	<i>scatmat - plot the lowertriangle plots and density plots of the scatter plot matrix.</i>
---------	---

---

**Description**

function for making scatterplots in the lower triangle and diagonal density plots.

**Usage**

```
scatmat(data, columns = 1:ncol(data), color = NULL, alpha = 1)
```

**Arguments**

data	a data matrix. Should contain numerical (continuous) data.
columns	an option to choose the column to be used in the raw dataset. Defaults to 1:ncol(data)
color	an option to group the dataset by the factor variable and color them by different colors. Defaults to NULL
alpha	an option to set the transparency in scatterplots for large data. Defaults to 1.

**Author(s)**

Mengjia Ni, Di Cook <dicook@monash.edu>

**Examples**

```
data(flea)
scatmat(flea, columns=2:4)
scatmat(flea, columns= 2:4, color="species")
```

---

singleClassOrder	<i>Order axis variables</i>
------------------	-----------------------------

---

**Description**

Order axis variables by separation between one class and the rest (most separation to least).

**Usage**

```
singleClassOrder(classVar, axisVars, specClass = NULL)
```

**Arguments**

classVar	class variable (vector from original dataset)
axisVars	variables to be plotted as axes (data frame)
specClass	character string matching to level of classVar; instead of looking for separation between any class and the rest, will only look for separation between this class and the rest

**Value**

character vector of names of axisVars ordered such that the first variable has the most separation between one of the classes and the rest, and the last variable has the least (as measured by F-statistics from an ANOVA)

**Author(s)**

Jason Crowley <crowley.jason.s@gmail.com>

---

skewness	<i>Sample skewness</i>
----------	------------------------

---

**Description**

Calculate the sample skewness of a vector while ignoring missing values.

**Usage**

```
skewness(x)
```

**Arguments**

x	numeric vector
---	----------------

**Value**

sample skewness of x

**Author(s)**

Jason Crowley <crowley.jason.s@gmail.com>

---

str.ggmatrix	<i>ggmatrix structure</i>
--------------	---------------------------

---

**Description**

View the condensed version of the ggmatrix object. The attribute "class" is ALWAYS altered to "\_class" to avoid recursion.

**Usage**

```
## S3 method for class 'ggmatrix'
str(object, ..., raw = FALSE)
```

**Arguments**

object	ggmatrix object to be viewed
...	passed on to the default str method
raw	boolean to determine if the plots should be converted to text or kept as original objects

---

twitter_spambots	<i>Twitter spambots</i>
------------------	-------------------------

---

**Description**

A network of spambots found on Twitter as part of a data mining project.

**Usage**

```
data(twitter_spambots)
```

**Format**

An object of class network with 120 edges and 94 vertices.

### Details

Each node of the network is identified by the Twitter screen name of the account and further carries five vertex attributes:

- location user's location, as provided by the user
- lat latitude, based on the user's location
- lon longitude, based on the user's location
- followers number of Twitter accounts that follow this account
- friends number of Twitter accounts followed by the account

### Author(s)

Amos Elberg

---

uppertriangle	<i>uppertriangle - rearrange dataset as the preparation of ggscatmat function</i>
---------------	---

---

### Description

function for making the dataset used to plot the uppertriangle plots.

### Usage

```
uppertriangle(  
  data,  
  columns = 1:ncol(data),  
  color = NULL,  
  corMethod = "pearson"  
)
```

### Arguments

data	a data matrix. Should contain numerical (continuous) data.
columns	an option to choose the column to be used in the raw dataset. Defaults to 1:ncol(data)
color	an option to choose a factor variable to be grouped with. Defaults to (NULL)
corMethod	method argument supplied to <a href="#">cor</a>

### Author(s)

Mengjia Ni, Di Cook <[dicook@monash.edu](mailto:dicook@monash.edu)>

**Examples**

```
data(flea)
head(uppertriangle(flea, columns=2:4))
head(uppertriangle(flea))
head(uppertriangle(flea, color="species"))
```

---

v1_ggmatrix_theme	<i>Modify a ggmatrix object by adding an ggplot2 object to all plots</i>
-------------------	--

---

**Description**

Modify a ggmatrix object by adding an ggplot2 object to all plots

**Usage**

```
v1_ggmatrix_theme()
```

**Examples**

```
ggpairs(iris, 1:2) + v1_ggmatrix_theme()
# move the column names to the left and bottom
ggpairs(iris, 1:2, switch = "both") + v1_ggmatrix_theme()
```

---

wrap_fn_with_param_arg	<i>Wrap a function with different parameter values</i>
------------------------	--

---

**Description**

Wraps a function with the supplied parameters to force different default behavior. This is useful for functions that are supplied to ggpairs. It allows you to change the behavior of one function, rather than creating multiple functions with different parameter settings.

**Usage**

```
wrap_fn_with_param_arg(
  funcVal,
  params = NULL,
  funcArgName = deparse(substitute(funcVal))
)

wrapp(funcVal, params = NULL, funcArgName = deparse(substitute(funcVal)))

wrap(funcVal, ..., funcArgName = deparse(substitute(funcVal)))

wrap_fn_with_params(funcVal, ..., funcArgName = deparse(substitute(funcVal)))
```

**Arguments**

funcVal	function that the params will be applied to. The function should follow the api of function(data,mapping,...){}. funcVal is allowed to be a string of one of the ggally_NAME functions, such as "points" for ggally_points or "facetdensity" for ggally_facetdensity.
params	named vector or list of parameters to be applied to the funcVal
funcArgName	name of function to be displayed
...	named parameters to be supplied to wrap_fn_with_param_arg

**Details**

wrap is identical to wrap\_fn\_with\_params. These function take the new parameters as arguments.

wrapp is identical to wrap\_fn\_with\_param\_arg. These functions take the new parameters as a single list.

The params and fn attributes are there for debugging purposes. If either attribute is altered, the function must be re-wrapped to have the changes take effect.

**Value**

a function(data,mapping,...){} that will wrap the original function with the parameters applied as arguments

**Examples**

```
# small function to display plots only if it's interactive
p_ <- GGally::print_if_interactive

# example function that prints 'val'
fn <- function(data, mapping, val = 2) {
  print(val)
}
fn(data = NULL, mapping = NULL) # 2

# wrap function to change default value 'val' to 5 instead of 2
wrapped_fn1 <- wrap(fn, val = 5)
wrapped_fn1(data = NULL, mapping = NULL) # 5
# you may still supply regular values
wrapped_fn1(data = NULL, mapping = NULL, val = 3) # 3

# wrap function to change 'val' to 5 using the arg list
wrapped_fn2 <- wrap_fn_with_param_arg(fn, params = list(val = 5))
wrapped_fn2(data = NULL, mapping = NULL) # 5

# change parameter settings in ggpairs for a particular function
## Goal output:
regularPlot <- ggally_points(
  iris,
  ggplot2::aes(Sepal.Length, Sepal.Width),
  size = 5, color = "red"
```

```
)  
p_(regularPlot)  
  
# Wrap ggally_points to have parameter values size = 5 and color = 'red'  
w_ggally_points <- wrap(ggally_points, size = 5, color = "red")  
wrappedPlot <- w_ggally_points(  
  iris,  
  ggplot2::aes(Sepal.Length, Sepal.Width)  
)  
p_(wrappedPlot)  
  
# Double check the aes parameters are the same for the geom_point layer  
identical(regularPlot$layers[[1]]$aes_params, wrappedPlot$layers[[1]]$aes_params)  
  
# Use a wrapped function in ggpairs  
pm <- ggpairs(iris, 1:3, lower = list(continuous = wrap(ggally_points, size = 5, color = "red")))  
p_(pm)  
pm <- ggpairs(iris, 1:3, lower = list(continuous = w_ggally_points))  
p_(pm)
```
