

Package ‘remotes’

February 15, 2020

Title R Package Installation from Remote Repositories, Including
'GitHub'

Version 2.1.1

Description Download and install R packages stored in 'GitHub', 'GitLab',
'Bitbucket', 'Bioconductor', or plain 'subversion' or 'git' repositories.
This package provides the 'install_*' functions in 'devtools'. Indeed most
of the code was copied over from 'devtools'.

License GPL (>= 2)

URL <https://remotes.r-lib.org>, <https://github.com/r-lib/remotes#readme>

BugReports <https://github.com/r-lib/remotes/issues>

Imports methods, stats, tools, utils

Suggests brew, callr, codetools, curl, covr, git2r (>= 0.23.0), knitr,
mockery, pkgbuild (>= 1.0.1), pingr, rmarkdown, rprojroot,
testthat, withr

Depends R (>= 3.0.0)

VignetteBuilder knitr

RoxygenNote 7.0.2

SystemRequirements Subversion for install_svn, git for install_git

Encoding UTF-8

NeedsCompilation no

install_bioc	4
install_bitbucket	5
install_cran	8
install_deps	9
install_dev	10
install_git	11
install_github	13
install_gitlab	15
install_local	17
install_svn	18
install_url	20
install_version	21
package_deps	23
parse-git-repo	25
update_packages	26
Index	28

download_version	<i>Download a specified version of a CRAN package</i>
------------------	---

Description

It downloads the package to a temporary file, and returns the name of the file.

Usage

```
download_version(
  package,
  version = NULL,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

package	package name
version	If the specified version is NULL or the same as the most recent version of the package, this function simply calls <code>utils::install.packages()</code> . Otherwise, it looks at the list of archived source tarballs and tries to install an older version instead.

repos	character vector, the base URL(s) of the repositories to use, e.g., the URL of a CRAN mirror such as "https://cloud.r-project.org". For more details on supported URL schemes see url . Can be NULL to install from local files, directories or URLs: this will be inferred by extension from pkgs if of length one.
type	character, indicating the type of package to download and install. Will be "source" except on Windows and some macOS builds: see the section on 'Binary packages' for those.
...	Other arguments passed on to <code>utils::install.packages()</code> .

Value

Name of the downloaded file.

github_pull

GitHub references

Description

Use as ref parameter to `install_github()`. Allows installing a specific pull request or the latest release.

Usage

```
github_pull(pull)
```

```
github_release()
```

Arguments

pull The pull request to install

See Also

[install_github\(\)](#)

install_bioc

Install a development package from the Bioconductor git repository

Description

This function requires `git` to be installed on your system in order to be used.

Usage

```
install_bioc(
  repo,
  mirror = getOption("BioC_git", download_url("git.bioconductor.org/packages")),
  git = c("auto", "git2r", "external"),
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

<code>repo</code>	Repository address in the format <code>[username:password@][release/]repo[#commit]</code> . Valid values for the release are 'devel', 'release' (the default if none specified), or numeric release numbers (e.g. '3.3').
<code>mirror</code>	The Bioconductor git mirror to use
<code>git</code>	Whether to use the <code>git2r</code> package, or an external git client via system. Default is <code>git2r</code> if it is installed, otherwise an external git installation.
<code>dependencies</code>	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
<code>upgrade</code>	One of "default", "ask", "always", or "never". "default" respects the value of the <code>R_REMOTES_UPGRADE</code> environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.

force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .

Details

It is vectorised so you can install multiple packages with a single command.

This is intended as an aid for Bioconductor developers. If you want to install the release version of a Bioconductor package one can use the BiocManager package.

See Also

Other package installation: [install_bitbucket\(\)](#), [install_cran\(\)](#), [install_dev\(\)](#), [install_github\(\)](#), [install_gitlab\(\)](#), [install_git\(\)](#), [install_local\(\)](#), [install_svn\(\)](#), [install_url\(\)](#), [install_version\(\)](#)

Examples

```
## Not run:
install_bioc("SummarizedExperiment")
install_bioc("release/SummarizedExperiment")
install_bioc("3.3/SummarizedExperiment")
install_bioc("SummarizedExperiment#abc123")
install_bioc("user:password@release/SummarizedExperiment")
install_bioc("user:password@devel/SummarizedExperiment")
install_bioc("user:password@SummarizedExperiment#abc123")

## End(Not run)
```

install_bitbucket	<i>Install a package directly from Bitbucket</i>
-------------------	--

Description

This function is vectorised so you can install multiple packages in a single command.

Usage

```
install_bitbucket(
  repo,
  ref = "master",
  subdir = NULL,
  auth_user = bitbucket_user(),
  password = bitbucket_password(),
  host = "api.bitbucket.org/2.0",
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

repo	Repository address in the format <code>username/repo[/subdir][@ref#pull]</code> . Alternatively, you can specify <code>subdir</code> and/or <code>ref</code> using the respective parameters (see below); if both is specified, the values in <code>repo</code> take precedence.
ref	Desired git reference; could be a commit, tag, or branch name. Defaults to master.
subdir	subdirectory within <code>repo</code> that contains the R package.
auth_user	your account username if you're attempting to install a package hosted in a private repository (and your username is different to <code>username</code>). Defaults to the <code>BITBUCKET_USER</code> environment variable.
password	your password. Defaults to the <code>BITBUCKET_PASSWORD</code> environment variable. See details for further information on setting up a password.
host	GitHub API host to use. Override with your GitHub enterprise hostname, for example, <code>"github.hostname.com/api/v3"</code> .
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the <code>R_REMOTES_UPGRADE</code> environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For

	non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .

Details

To install from a private repo, or more generally, access the Bitbucket API with your own credentials, you will need to get an access token. You can create an access token following the instructions found in the [Bitbucket App Passwords documentation](#). The App Password requires read-only access to your repositories and pull requests. Then store your password in the environment variable `BITBUCKET_PASSWORD` (e.g. `evelynwaugh:swordofhonour`)

Note that on Windows, authentication requires the "libcurl" download method. You can set the default download method via the `download.file.method` option:

```
options(download.file.method = "libcurl")
```

In particular, if unset, RStudio sets the download method to "wininet". To override this, you might want to set it to "libcurl" in your R profile, see [base::Startup](#). The caveat of the "libcurl" method is that it does *not* set the system proxies automatically, see "Setting Proxies" in [utils::download.file\(\)](#).

Other package installation: [install_bioc\(\)](#), [install_cran\(\)](#), [install_dev\(\)](#), [install_github\(\)](#), [install_gitlab\(\)](#), [install_git\(\)](#), [install_local\(\)](#), [install_svn\(\)](#), [install_url\(\)](#), [install_version\(\)](#)

Examples

```
## Not run:
install_bitbucket("sulab/mygene.r@default")
install_bitbucket("djenavarro/lr")

## End(Not run)
```

install_cran	<i>Attempts to install a package from CRAN.</i>
--------------	---

Description

This function is vectorised on `pkgs` so you can install multiple packages in a single command.

Usage

```
install_cran(
  pkgs,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  ...
)
```

Arguments

<code>pkgs</code>	Character vector of packages to install.
<code>repos</code>	A character vector giving repositories to use.
<code>type</code>	Type of package to update.
<code>dependencies</code>	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
<code>upgrade</code>	One of "default", "ask", "always", or "never". "default" respects the value of the <code>R_REMOTES_UPGRADE</code> environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
<code>force</code>	Force installation, even if the remote state has not changed since the previous install.
<code>quiet</code>	If TRUE, suppress output.
<code>build</code>	If TRUE build the package before installing.

build_opts Options to pass to R CMD build, only used when build
 build_manual If FALSE, don't build PDF manual ('-no-manual').
 build_vignettes
 If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
 ... Other arguments passed on to `utils::install.packages()`.

See Also

Other package installation: `install_bioc()`, `install_bitbucket()`, `install_dev()`, `install_github()`, `install_gitlab()`, `install_git()`, `install_local()`, `install_svn()`, `install_url()`, `install_version()`

Examples

```
## Not run:
install_cran("ggplot2")
install_cran(c("httpuv", "shiny"))

## End(Not run)
```

<code>install_deps</code>	<i>Install package dependencies if needed.</i>
---------------------------	--

Description

Install package dependencies if needed.

Usage

```
install_deps(
  pkgdir = ".",
  dependencies = NA,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  upgrade = c("default", "ask", "always", "never"),
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  ...
)
```

Arguments

pkgdir	path to a package directory, or to a package tarball.
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
repos	A character vector giving repositories to use.
type	Type of package to update.
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
...	additional arguments passed to <code>utils::install.packages()</code> .

Examples

```
## Not run: install_deps(".")
```

install_dev	<i>Install the development version of a package</i>
-------------	---

Description

install_dev() retrieves the package DESCRIPTION from the CRAN mirror and looks in the 'URL' and 'BugReports' fields for GitHub, GitLab or Bitbucket URLs. It then calls the appropriate install_() function to install the development package.

Usage

```
install_dev(package, cran_url = getOption("repos")[["CRAN"]], ...)
```

Arguments

package	The package name to install.
cran_url	The URL of the CRAN mirror to use, by default based on the 'repos' option. If unset uses 'https://cloud.r-project.org'.
...	Additional arguments passed to install_github() , install_gitlab() , or install_bitbucket() functions.

See Also

Other package installation: [install_bioc\(\)](#), [install_bitbucket\(\)](#), [install_cran\(\)](#), [install_github\(\)](#), [install_gitlab\(\)](#), [install_git\(\)](#), [install_local\(\)](#), [install_svn\(\)](#), [install_url\(\)](#), [install_version\(\)](#)

Examples

```
## Not run:
# From GitHub
install_dev("dplyr")

# From GitLab
install_dev("iemiscdata")

# From Bitbucket
install_dev("argparser")

## End(Not run)
```

install_git

Install a package from a git repository

Description

It is vectorised so you can install multiple packages with a single command. You do not need to have the git2r package, or an external git client installed.

Usage

```
install_git(
  url,
  subdir = NULL,
  ref = NULL,
  branch = NULL,
  credentials = git_credentials(),
  git = c("auto", "git2r", "external"),
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
```

```

    build = TRUE,
    build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
    build_manual = FALSE,
    build_vignettes = FALSE,
    repos = getOption("repos"),
    type = getOption("pkgType"),
    ...
  )

```

Arguments

<code>url</code>	Location of package. The url should point to a public or private repository.
<code>subdir</code>	A sub-directory within a git repository that may contain the package we are interested in installing.
<code>ref</code>	Name of branch, tag or SHA reference to use, if not HEAD.
<code>branch</code>	Deprecated, synonym for <code>ref</code> .
<code>credentials</code>	A <code>git2r</code> credentials object passed through to clone. Supplying this argument implies using <code>git2r</code> with <code>git</code> .
<code>git</code>	Whether to use the <code>git2r</code> package, or an external <code>git</code> client via <code>system</code> . Default is <code>git2r</code> if it is installed, otherwise an external <code>git</code> installation.
<code>dependencies</code>	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
<code>upgrade</code>	One of "default", "ask", "always", or "never". "default" respects the value of the <code>R_REMOTES_UPGRADE</code> environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
<code>force</code>	Force installation, even if the remote state has not changed since the previous install.
<code>quiet</code>	If TRUE, suppress output.
<code>build</code>	If TRUE build the package before installing.
<code>build_opts</code>	Options to pass to R CMD build, only used when <code>build</code>
<code>build_manual</code>	If FALSE, don't build PDF manual (<code>'--no-manual'</code>).
<code>build_vignettes</code>	If FALSE, don't build package vignettes (<code>'--no-build-vignettes'</code>). is TRUE.
<code>repos</code>	A character vector giving repositories to use.
<code>type</code>	Type of package to update.
<code>...</code>	Other arguments passed on to <code>utils::install.packages()</code> .

Details

If you need to set git credentials for use in the Remotes field you can do so by placing the credentials in the `remotes.git_credentials` global option.

See Also

Other package installation: [install_bioc\(\)](#), [install_bitbucket\(\)](#), [install_cran\(\)](#), [install_dev\(\)](#), [install_github\(\)](#), [install_gitlab\(\)](#), [install_local\(\)](#), [install_svn\(\)](#), [install_url\(\)](#), [install_version\(\)](#)

Examples

```
## Not run:
install_git("git://github.com/hadley/stringr.git")
install_git("git://github.com/hadley/stringr.git", ref = "stringr-0.2")

## End(Not run)
```

install_github

Attempts to install a package directly from GitHub.

Description

This function is vectorised on repo so you can install multiple packages in a single command.

Usage

```
install_github(
  repo,
  ref = "master",
  subdir = NULL,
  auth_token = github_pat(quiet),
  host = "api.github.com",
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

repo	Repository address in the format <code>username/repo[/subdir][@ref#pull]</code> . Alternatively, you can specify <code>subdir</code> and/or <code>ref</code> using the respective parameters (see below); if both is specified, the values in <code>repo</code> take precedence.
ref	Desired git reference. Could be a commit, tag, or branch name, or a call to <code>github_pull()</code> . Defaults to "master".
subdir	subdirectory within <code>repo</code> that contains the R package.
auth_token	To install from a private repo, generate a personal access token (PAT) in "https://github.com/settings/tokens" and supply to this argument. This is safer than using a password because you can easily delete a PAT without affecting any others. Defaults to the <code>GITHUB_PAT</code> environment variable.
host	GitHub API host to use. Override with your GitHub enterprise hostname, for example, "github.hostname.com/api/v3".
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the <code>R_REMOTES_UPGRADE</code> environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .

Details

If the repository uses submodules a command-line git client is required to clone the submodules.

Other package installation: [install_bioc\(\)](#), [install_bitbucket\(\)](#), [install_cran\(\)](#), [install_dev\(\)](#), [install_gitlab\(\)](#), [install_git\(\)](#), [install_local\(\)](#), [install_svn\(\)](#), [install_url\(\)](#), [install_version\(\)](#)

Examples

```
## Not run:
install_github("klutometis/roxygen")
install_github("wch/ggplot2")
install_github(c("rstudio/httpuv", "rstudio/shiny"))
install_github(c("hadley/httr@v0.4", "klutometis/roxygen#142",
  "mfrasca/r-logging/pkg"))

# To install from a private repo, use auth_token with a token
# from https://github.com/settings/tokens. You only need the
# repo scope. Best practice is to save your PAT in env var called
# GITHUB_PAT.
install_github("hadley/private", auth_token = "abc")

## End(Not run)
```

install_gitlab	<i>Install a package from GitLab</i>
----------------	--------------------------------------

Description

This function is vectorised on `repo` so you can install multiple packages in a single command. Like other remotes the repository will skip installation if `force == FALSE` (the default) and the remote state has not changed since the previous installation.

Usage

```
install_gitlab(
  repo,
  subdir = NULL,
  auth_token = gitlab_pat(quiet),
  host = "gitlab.com",
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

repo	Repository address in the format username/repo[@ref].
subdir	subdirectory within repo that contains the R package.
auth_token	To install from a private repo, generate a personal access token (PAT) in https://gitlab.com/profile/personal_access_tokens and supply to this argument. This is safer than using a password because you can easily delete a PAT without affecting any others. Defaults to the GITLAB_PAT environment variable.
host	GitLab API host to use. Override with your GitLab enterprise hostname, for example, "gitlab.hostname.com".
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .

See Also

Other package installation: `install_bioc()`, `install_bitbucket()`, `install_cran()`, `install_dev()`, `install_github()`, `install_git()`, `install_local()`, `install_svn()`, `install_url()`, `install_version()`

Examples

```
## Not run:
install_gitlab("jimhester/covr")

## End(Not run)
```

install_local	<i>Install a package from a local file</i>
---------------	--

Description

This function is vectorised so you can install multiple packages in a single command.

Usage

```
install_local(
  path = ".",
  subdir = NULL,
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = !is_binary_pkg(path),
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

path	path to local directory, or compressed file (tar, zip, tar.gz tar.bz2, tgz2 or tbz)
subdir	subdirectory within url bundle that contains the R package.
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.

build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .

See Also

Other package installation: `install_bioc()`, `install_bitbucket()`, `install_cran()`, `install_dev()`, `install_github()`, `install_gitlab()`, `install_git()`, `install_svn()`, `install_url()`, `install_version()`

Examples

```
## Not run:
dir <- tempfile()
dir.create(dir)
pkg <- download.packages("testthat", dir, type = "source")
install_local(pkg[, 2])

## End(Not run)
```

install_svn

Install a package from a SVN repository

Description

This function requires svn to be installed on your system in order to be used.

Usage

```
install_svn(
  url,
  subdir = NULL,
  args = character(0),
  revision = NULL,
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

url	Location of package. The url should point to a public or private repository.
subdir	A sub-directory within a svn repository that contains the package we are interested in installing.
args	A character vector providing extra options to pass on to svn.
revision	svn revision, if omitted updates to latest
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .

Details

It is vectorised so you can install multiple packages with a single command.

See Also

Other package installation: `install_bioc()`, `install_bitbucket()`, `install_cran()`, `install_dev()`, `install_github()`, `install_gitlab()`, `install_git()`, `install_local()`, `install_url()`, `install_version()`

Examples

```
## Not run:
install_svn("https://github.com/hadley/stringr/trunk")
install_svn("https://github.com/hadley/httr/branches/oauth")

## End(Not run)
```

install_url

Install a package from a url

Description

This function is vectorised so you can install multiple packages in a single command.

Usage

```
install_url(
  url,
  subdir = NULL,
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)
```

Arguments

url	location of package on internet. The url should point to a zip file, a tar file or a bziped/gzipped tar file.
subdir	subdirectory within url bundle that contains the R package.
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).

upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .

See Also

Other package installation: `install_bioc()`, `install_bitbucket()`, `install_cran()`, `install_dev()`, `install_github()`, `install_gitlab()`, `install_git()`, `install_local()`, `install_svn()`, `install_version()`

Examples

```
## Not run:
install_url("https://github.com/hadley/stringr/archive/master.zip")

## End(Not run)
```

install_version	<i>Install specified version of a CRAN package.</i>
-----------------	---

Description

If you are installing an package that contains compiled code, you will need to have an R development environment installed. You can check if you do by running `devtools::has_devel` (you need the `devtools` package for this).

Usage

```
install_version(
  package,
  version = NULL,
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = FALSE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = "source",
  ...
)
```

Arguments

package	package name
version	If the specified version is NULL or the same as the most recent version of the package, this function simply calls <code>utils::install.packages()</code> . Otherwise, it looks at the list of archived source tarballs and tries to install an older version instead.
dependencies	logical indicating whether to also install uninstalled packages which these packages depend on/link to/import/suggest (and so on recursively). Not used if <code>repos = NULL</code> . Can also be a character vector, a subset of <code>c("Depends", "Imports", "LinkingTo", "Suggests")</code> . Only supported if <code>lib</code> is of length one (or missing), so it is unambiguous where to install the dependent packages. If this is not the case it is ignored, with a warning. The default, NA, means <code>c("Depends", "Imports", "LinkingTo")</code> . TRUE means to use <code>c("Depends", "Imports", "LinkingTo", "Suggests")</code> for <code>pkgs</code> and <code>c("Depends", "Imports", "LinkingTo")</code> for added dependencies: this installs all the packages needed to run <code>pkgs</code> , their examples, tests and vignettes (if the package author specified them correctly). In all of these, "LinkingTo" is omitted for binary packages.
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the <code>R_REMOTES_UPGRADE</code> environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	logical: if true, reduce the amount of output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build

build_manual If FALSE, don't build PDF manual ('-no-manual').
 build_vignettes If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
 repos character vector, the base URL(s) of the repositories to use, e.g., the URL of a CRAN mirror such as "https://cloud.r-project.org". For more details on supported URL schemes see [url](#).
 Can be NULL to install from local files, directories or URLs: this will be inferred by extension from pkgs if of length one.
 type character, indicating the type of package to download and install. Will be "source" except on Windows and some macOS builds: see the section on 'Binary packages' for those.
 ... Other arguments passed on to `utils::install.packages()`.

package_deps

Find all dependencies of a CRAN or dev package.

Description

Find all the dependencies of a package and determine whether they are ahead or behind CRAN. A `print()` method identifies mismatches (if any) between local and CRAN versions of each dependent package; an `update()` method installs outdated or missing packages from CRAN.

Usage

```

package_deps(
  packages,
  dependencies = NA,
  repos = getOption("repos"),
  type = getOption("pkgType")
)

local_package_deps(pkgdir = ".", dependencies = NA)

dev_package_deps(
  pkgdir = ".",
  dependencies = NA,

```

```

    repos = getOption("repos"),
    type = getOption("pkgType")
  )

  ## S3 method for class 'package_deps'
  update(
    object,
    dependencies = NA,
    upgrade = c("default", "ask", "always", "never"),
    force = FALSE,
    quiet = FALSE,
    build = TRUE,
    build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
    build_manual = FALSE,
    build_vignettes = FALSE,
    repos = getOption("repos"),
    type = getOption("pkgType"),
    ...
  )

```

Arguments

packages	A character vector of package names.
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
repos	A character vector giving repositories to use.
type	Type of package to update.
pkgdir	path to a package directory, or to a package tarball.
object	A package_deps object.
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').

```

build_vignettes      If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
...                  Additional arguments passed to install_packages.

```

Value

A data.frame with columns:

```

package  The dependent package's name,
installed The currently installed version,
available The version available on CRAN,
diff     An integer denoting whether the locally installed version of the package is newer (1), the same (0) or older (-1)

```

Examples

```

## Not run:
package_deps("devtools")
# Use update to update any out-of-date dependencies
update(package_deps("devtools"))

## End(Not run)

```

```

parse-git-repo      Parse a remote git repo specification

```

Description

A remote repo can be specified in two ways:

as a URL `parse_github_url()` handles HTTPS and SSH remote URLs and various GitHub browser URLs

via a shorthand `parse_repo_spec()` handles this concise form: [username/]repo[/subdir][#pull@ref@*release]

Usage

```

parse_repo_spec(repo)

parse_github_repo_spec(repo)

parse_github_url(repo)

```

Arguments

`repo` Character scalar, the repo specification.

Value

List with members: username, repo, subdir, ref, pull, release, some which will be empty.

Examples

```

parse_repo_spec("metacran/crandb")
parse_repo_spec("jimhester/covr#47")      ## pull request
parse_repo_spec("jeroen/curl@v0.9.3")     ## specific tag
parse_repo_spec("tidyverse/dplyr@*release") ## shorthand for latest release
parse_repo_spec("r-lib/remotes@550a3c7d3f9e1493a2ba") ## commit SHA
parse_repo_spec("igraph=igraph/rigraph") ## Different package name from repo name

parse_github_url("https://github.com/jeroen/curl.git")
parse_github_url("git@github.com:metacran/crandb.git")
parse_github_url("https://github.com/jimhester/covr")
parse_github_url("https://github.example.com/user/repo.git")
parse_github_url("git@github.example.com:user/repo.git")

parse_github_url("https://github.com/r-lib/remotes/pull/108")
parse_github_url("https://github.com/r-lib/remotes/tree/name-of-branch")
parse_github_url("https://github.com/r-lib/remotes/commit/1234567")
parse_github_url("https://github.com/r-lib/remotes/releases/latest")
parse_github_url("https://github.com/r-lib/remotes/releases/tag/1.0.0")

```

```
update_packages
```

```
Update packages that are missing or out-of-date.
```

Description

Works similarly to `utils::install.packages()` but doesn't install packages that are already installed, and also upgrades out dated dependencies.

Usage

```

update_packages(
  packages = TRUE,
  dependencies = NA,
  upgrade = c("default", "ask", "always", "never"),
  force = FALSE,
  quiet = FALSE,
  build = TRUE,
  build_opts = c("--no-resave-data", "--no-manual", "--no-build-vignettes"),
  build_manual = FALSE,
  build_vignettes = FALSE,
  repos = getOption("repos"),
  type = getOption("pkgType"),
  ...
)

```

Arguments

packages	Character vector of packages to update.
dependencies	Which dependencies do you want to check? Can be a character vector (selecting from "Depends", "Imports", "LinkingTo", "Suggests", or "Enhances"), or a logical vector. TRUE is shorthand for "Depends", "Imports", "LinkingTo" and "Suggests". NA is shorthand for "Depends", "Imports" and "LinkingTo" and is the default. FALSE is shorthand for no dependencies (i.e. just check this package, not its dependencies).
upgrade	One of "default", "ask", "always", or "never". "default" respects the value of the R_REMOTES_UPGRADE environment variable if set, and falls back to "ask" if unset. "ask" prompts the user for which out of date packages to upgrade. For non-interactive sessions "ask" is equivalent to "always". TRUE and FALSE are also accepted and correspond to "always" and "never" respectively.
force	Force installation, even if the remote state has not changed since the previous install.
quiet	If TRUE, suppress output.
build	If TRUE build the package before installing.
build_opts	Options to pass to R CMD build, only used when build
build_manual	If FALSE, don't build PDF manual ('-no-manual').
build_vignettes	If FALSE, don't build package vignettes ('-no-build-vignettes'). is TRUE.
repos	A character vector giving repositories to use.
type	Type of package to update.
...	Other arguments passed on to <code>utils::install.packages()</code> .
