Package 'sdcLog'

October 8, 2021

Title Tools for Statistical Disclosure Control in Research Data Centers

Version 0.4.0

Description Tools for researchers to explicitly show that their results comply to rules for statistical disclosure control imposed by research data centers. These tools help in checking descriptive statistics and models and in calculating extreme values that are not individual data. Also included is a simple function to create log files. The methods used here are described in the ``Guidelines for the checking of output based on microdata research" by Bond, Brandt, and de Wolf (2015) <https://ec.europa.eu/eurostat/cros/system/files/dwb_standalone-document_output-checking-guidelines.pdf>.

`common_arguments` *arguments*

Description

arguments

Arguments

`data`	data.frame from which the descriptive statistics are calculated.
`id_var`	character The name of the id variable. Defaults to `getOption("sdc.id_var")` so that you can provide `options(sdc.id_var = "my_id_var")` at the top of your script.
`val_var`	character vector of value variables on which descriptive statistics are computed.
`by`	character vector of grouping variables.
`zero_as_NA`	logical If TRUE, zeros in 'val_var' are treated as NA.
`model`	The estimated model object. Can be a model type like lm, glm and various others (anything which can be handled by `broom::augment()`).
`min_obs`	integer The minimum number of observations used to calculate the minimum and maximum. Defaults to `getOption("sdc.n_ids",5L)`. *This is not the number of distinct entities.*
`max_obs`	integer The maximum number of observations used to calculate the minimum and maximum. Defaults to `nrow(data)`. *This is not the number of distinct entities.*

`sdc_descriptives` *Disclosure control for descriptive statistics*

Description

Checks the number of distinct entities and the (n, k) dominance rule for your descriptive statistics.

That means that `sdc_descriptives()` checks if there are at least 5 distinct entities and if the largest 2 entities account for 85% or more of `val_var`. The parameters can be changed using options. For details see `vignette("options",package = "sdcLog")`.

Usage

```
sdc_descriptives(
  data,
  id_var = getOption("sdc.id_var"),
  val_var = NULL,
  by = NULL,
  zero_as_NA = NULL
)
```

Arguments

`data`	data.frame from which the descriptive statistics are calculated.
`id_var`	character The name of the id variable. Defaults to `getOption("sdc.id_var")` so that you can provide `options(sdc.id_var = "my_id_var")` at the top of your script.
`val_var`	character vector of value variables on which descriptive statistics are computed.
`by`	character vector of grouping variables.
`zero_as_NA`	logical If TRUE, zeros in 'val_var' are treated as NA.

Details

The general form of the (n, k) dominance rule can be formulated as:

$$\sum_{i=1}^{n} x_i > \frac{k}{100} \sum_{i=1}^{N} x_i$$

where $x_1 \geq x_2 \geq \cdots \geq x_N$. n denotes the number of largest contributions to be considered, x_n the n-th largest contribution, k the maximal percentage these n contributions may account for, and N is the total number of observations.

If the statement above is true, the (n, k) dominance rule is violated.

Value

A list of class `sdc_descriptives` with detailed information about options, settings, and compliance with the criteria distinct entities and dominance.

Examples

```
sdc_descriptives(
  data = sdc_descriptives_DT,
  id_var = "id",
  val_var = "val_1"
)

sdc_descriptives(
  data = sdc_descriptives_DT,
  id_var = "id",
  val_var = "val_1",
  by = "sector"
)

sdc_descriptives(
  data = sdc_descriptives_DT,
  id_var = "id",
  val_var = "val_1",
  by = c("sector", "year")
)

sdc_descriptives(
  data = sdc_descriptives_DT,
  id_var = "id",
  val_var = "val_2",
  by = c("sector", "year")
)

sdc_descriptives(
  data = sdc_descriptives_DT,
  id_var = "id",
  val_var = "val_2",
  by = c("sector", "year"),
  zero_as_NA = FALSE
)
```

---

sdc_descriptives_DT *Example data for* sdc_descriptives()

Description

Utilized in the vignette.

Usage

```
data("sdc_descriptives_DT")
```

Format

A data.table with 20 rows and 5 columns.

Details

The data.table contains the following columns:

- id factor random identifier
- sector factor economic sector
- year integer time variable
- val_1, val_2 numeric value variables

---

sdc_log *Create Stata-like log files from R Scripts*

Description

This function creates Stata-like log files from R Scripts. It can handle several files (in a character vector) at once.

Usage

```
sdc_log(r_script, destination, replace = FALSE, append = FALSE, local = FALSE)
```

Arguments

r_script	character Path of the R script to be run with logging.
destination	One of: • character Path of the log file to be used. • file connection to which the log should be written. This is especially useful, when you have nested calls to sdc_log() and want to write everything into the same log file. Then, create a single file connection and provide this connection to all calls to sdc_log() (and close it afterwards).
replace	logical Indicates whether to replace an existing log file.
append	logical Indicates whether to append an existing log file.
local	One of: • logical Indicates whether to evaluate within the global environment (FALSE) or the calling environment (TRUE). • environment A specific evaluation environment. Determines the evaluation environment. Useful whenever sdc_log() is called from within a function, or for nested sdc_log() calls. By default (FALSE) evaluation occurs in the global environment. See also source.

Value

character vector holding the path(s) of the written log file(s).

`sdc_min_max` *Calculate RDC rule-compliant extreme values*

Description

Checks if calculation of extreme values comply to RDC rules. If so, function returns average min and max values according to RDC rules.

Usage

```
sdc_min_max(
  data,
  id_var = getOption("sdc.id_var"),
  val_var,
  by = NULL,
  max_obs = nrow(data)
)
```

Arguments

`data`	data.frame from which the descriptive statistics are calculated.
`id_var`	character The name of the id variable. Defaults to `getOption("sdc.id_var")` so that you can provide `options(sdc.id_var = "my_id_var")` at the top of your script.
`val_var`	character vector of value variables on which descriptive statistics are computed.
`by`	character vector of grouping variables.
`max_obs`	integer The maximum number of observations used to calculate the minimum and maximum. Defaults to `nrow(data)`. *This is not the number of distinct entities.*

Value

A list list of class `sdc_min_max` with detailed information about options, settings and the calculated extreme values (if possible).

Examples

```
sdc_min_max(sdc_min_max_DT, id_var = "id", val_var = "val_1")
sdc_min_max(sdc_min_max_DT, id_var = "id", val_var = "val_2")
sdc_min_max(sdc_min_max_DT, id_var = "id", val_var = "val_3", max_obs = 10)
sdc_min_max(sdc_min_max_DT, id_var = "id", val_var = "val_1", by = "year")
sdc_min_max(
  sdc_min_max_DT, id_var = "id", val_var = "val_1", by = c("sector", "year")
)
```

sdc_min_max_DT *Example data for* sdc_min_max()

Description

Utilized in the vignette

Usage

```
data("sdc_min_max_DT")
```

Format

A data.table with 20 rows and 6 columns.

Details

The data.table contains the following columns:

- id factor random identifier
- sector factor economic sector
- year integer time variable
- val_1 - val_3 numeric value variables

sdc_model *Disclosure control for models*

Description

Checks if your model complies to RDC rules. Checks for overall number of entities and number of entities for each level of dummy variables.

Usage

```
sdc_model(data, model, id_var = getOption("sdc.id_var"))
```

Arguments

data	data.frame which was used to build the model.
model	The estimated model object. Can be a model type like lm, glm and various others (anything which can be handled by broom::augment()).
id_var	character The name of the id variable. Defaults to getOption("sdc.id_var") so that you can provide options(sdc.id_var = "my_id_var") at the top of your script.

Value

A list of class sdc_model with detailed information about options, settings, and compliance with the distinct entities criterion.

Examples

```
# Check simple models
model_1 <- lm(y ~ x_1 + x_2, data = sdc_model_DT)
sdc_model(data = sdc_model_DT, model = model_1, id_var = "id")

model_2 <- lm(y ~ x_1 + x_2 + x_3, data = sdc_model_DT)
sdc_model(data = sdc_model_DT, model = model_2, id_var = "id")

model_3 <- lm(y ~ x_1 + x_2 + dummy_3, data = sdc_model_DT)
sdc_model(data = sdc_model_DT, model = model_3, id_var = "id")
```

---

sdc_model_DT *Example data for* sdc_model()

Description

Utilized in the vignette

Usage

```
data("sdc_model_DT")
```

Format

A data.table with 80 rows and 9 columns.

Details

The data.table contains the following columns:

- id factor random identifier
- y - x_4 numeric value variables
- dummy_1 - dummy_3 factor dummy variables
